

COSMOLOGICAL HYDROGEN RECOMBINATION: THE EFFECT OF HIGH-N STATES

Daniel Grin

in collaboration with Chris Hirata and Yacine Ali-Haïmoud
Caltech

Paris Recombination Conference
LPT Orsay, 09/07/09

OUTLINE

- The history of high- n and recombination
- Our tools: RecSparse
- High- n and Recombination histories
- Quadrupole transitions
- Quadrupole transitions and Recombination histories
- Results: Recombination histories, effects on CMB
- Ongoing work

EQUILIBRIUM ASSUMPTIONS

- Radiative eq. between different n-states

$$\mathcal{N}_n = \mathcal{N}_2 e^{-(E_n - E_2)/T}$$

- Radiative/collisional eq. between different l

$$\mathcal{N}_{nl} = \mathcal{N}_n \frac{(2l + 1)}{n^2}$$

- Matter in eq. with radiation due to Thompson scattering

$$T_m = T_\gamma \text{ since } \frac{\sigma_T a T_\gamma^4 c}{m_e c^2} < H(T)$$

BREAKING THE NAIVE MODEL

- Radiation field is cool: ~~Boltzmann eq. of higher n~~
- Seager/Sasselov/Scott (2000) $n_{\max} = 300$ RecFAST!!!
- ~~Equilibrium~~ between *l states*
- Treated by Chluba et al. (2005) for $n_{\max} = 100$
- Radiation and matter field fall out of eq.

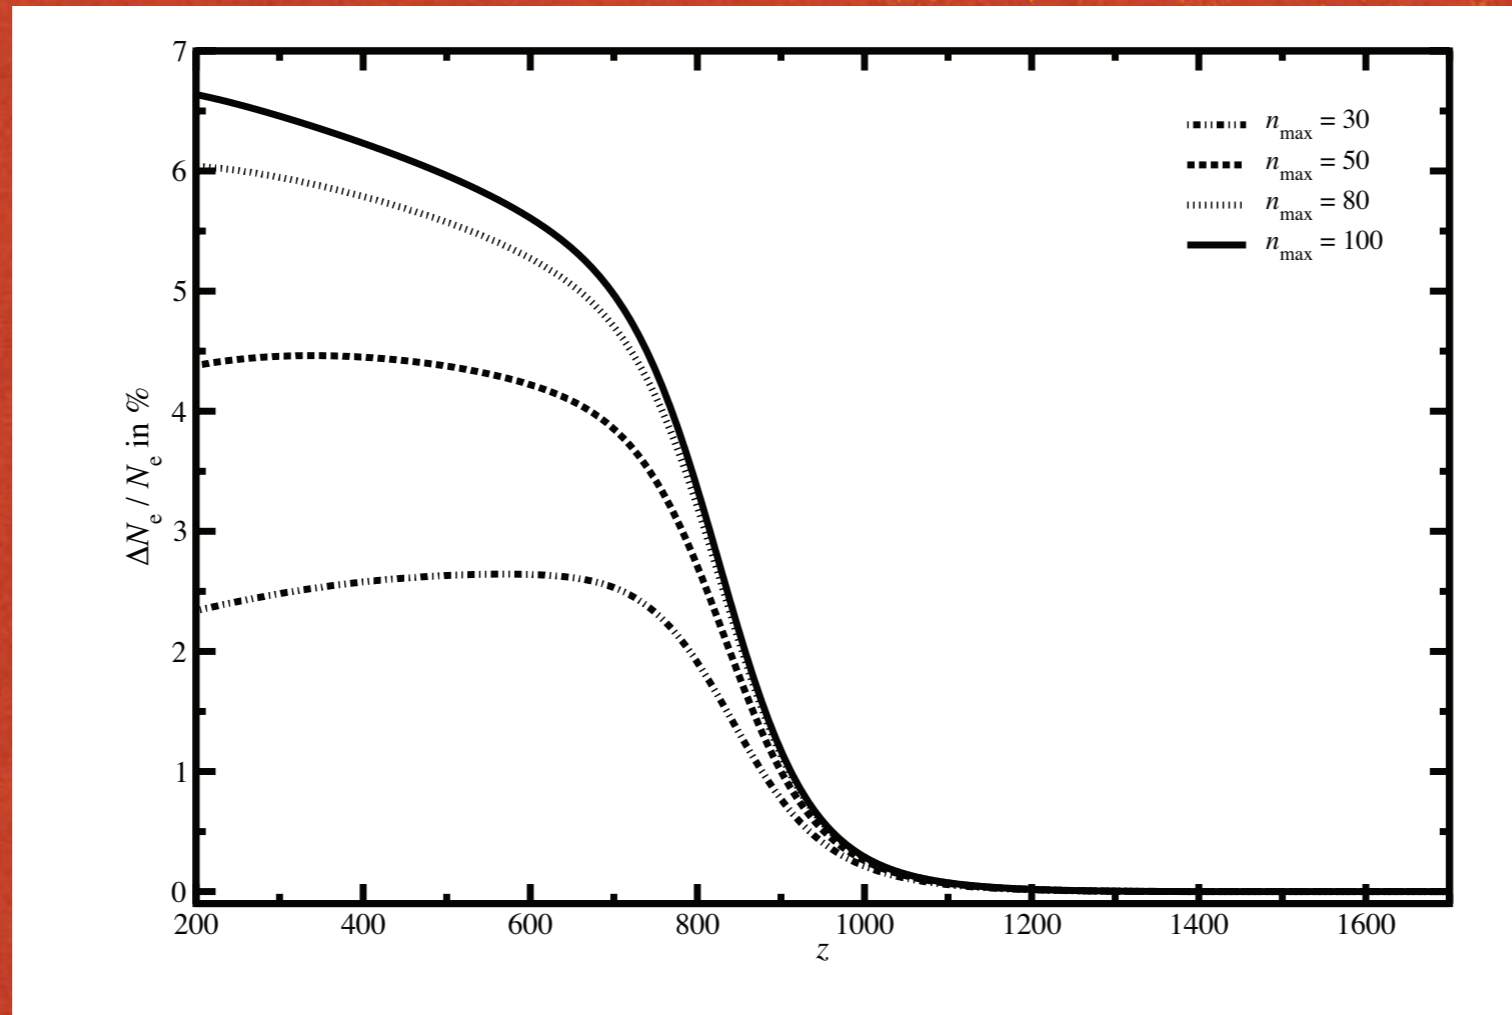

$$\dot{T}_M + 2HT_m = \frac{8x_e\sigma_T a T_\gamma^4}{3m_e c (1 + f_{\text{He}} + x_e)} (T_M - T_\gamma)$$

BREAKING THE NAIVE MODEL

- Radiation field is cool: ~~Boltzmann eq. of higher n~~
- Treated by Seager et al. (2000) $n_{\max} = 300$ RecFAST!!!
- ~~Equilibrium~~ between l states
- Treated by Chluba et al. (2005) for $n_{\max} = 100$
- Beyond this, testing convergence with n_{\max} is hard!
 $t_{\text{compute}} \sim \mathcal{O}(\text{weeks})$

How to proceed if we want 0.1% accuracy in $x_e(z)$?

THE EFFECT OF RESOLVING 1- SUBSTATES

- Putting free-electrons in ‘bottlenecked’ 1-substates slows down the decay to 1s: Recombination is slower; Chluba, Rubino-Martin, Sunyaev 2006

BREAKING THE NAIVE MODEL

- Radiation field is cool: ~~Boltzmann eq. of higher n~~
- Treated by Seager et al. (2000) $n_{\max} = 300$ RecFAST!!!
- Eq. between l states: dipole selection bottleneck: $\Delta l = \pm 1$
- Treated by Chluba et al. (2005) for $n_{\max} = 100$
- Beyond this, testing convergence with n_{\max} is hard!
 $t_{\text{compute}} \sim \mathcal{O}(\text{weeks})$

THE MULTI-LEVEL ATOM (MLA)

- Bound-free rate equation

$$\dot{x}_{nl}^{bf} = \int dE_e P_M(T_m, E_e) n_H x_e x_p [1 + f(E_e - E_n)] \alpha_{nl}(E_e) \\ - \int dE_e g(E_e - E_n) x_{nl} f(E_e - E_n) \alpha_{nl}(E_e) / g_{nl}$$

- Bound-bound rate equation

$$\dot{x}_{nl}^{bb} = \sum_{n', l' = l \pm 1} (A_{nn'}^{ll'} (1 + f_{nn'}) x_{n', l'} - \frac{g_{n' l'}}{g_{nl}} f_{nn'} x_{nl}) P_{nn'}^{ll'}$$

THE MULTI-LEVEL ATOM (MLA)

- Bound-free rate equation

$$\dot{x}_{nl}^{bf} = \int dE_e P_M(T_m, E_e) n_H x_e x_p [1 + f(E_e - E_n)] \alpha_{nl}(E_e) - \int dE_e g(E_E - E_n) x_{nl} f(E_e - E_{nl}) \alpha_{nl}(E_E) / g_{nl}$$

- Bound-bound rate equation

$$\dot{x}_{nl}^{bb} = \sum_{n', l' = l \pm 1} (A_{nn'}^{ll'} (1 + f_{nn'}) x_{n', l'} - \frac{g_{n' l'}}{g_{nl}} f_{nn'} x_{nl}) P_{nn'}^{ll'}$$

Ω_m, Ω_b, h

THE MULTI-LEVEL ATOM (MLA)

- Bound-free rate equation

$$\dot{x}_{nl}^{bf} = \int dE_e P_M(T_m, E_e) n_H x_e x_p [1 + f(E_e - E_n)] \alpha_{nl}(E_e) - \int dE_e g(E_e - E_n) x_{nl} f(E_e - E_{nl}) \alpha_{nl}(E_e) / g_{nl}$$

- Bound-bound rate equation

$$\dot{x}_{nl}^{bb} = \sum_{n', l' = l \pm 1} (A_{nn'}^{ll'} (1 + f_{nn'}) x_{n', l'} - \frac{g_{n' l'}}{g_{nl}} f_{nn'} x_{nl}) P_{nn'}^{ll'}$$

- Phase-space density blueward of line
- Escape probability of γ in line

THE MULTI-LEVEL ATOM (MLA)

Stimulated emission/absorption

- Bound-free rate equation

$$\dot{x}_{nl}^{bf} = \int dE_e P_M(T_m, E_e) n_H x_e x_p [1 + f(E_e - E_n)] \alpha_{nl}(E_e) - \int dE_e g(E_E - E_n) x_{nl} f(E_e - E_{nl}) \alpha_{nl}(E_E) / g_{nl}$$

- Bound-bound rate equation

$$\dot{x}_{nl}^{bb} = \sum_{n', l' = l \pm 1} (A_{nn'}^{ll'} (1 + f_{nn'}) x_{n', l'} - \frac{g_{n' l'}}{g_{nl}} f_{nn'} x_{nl}) P_{nn'}^{ll'}$$

THE MULTI-LEVEL ATOM (MLA)

Spontaneous Emission

- Bound-free rate equation

$$\dot{x}_{nl}^{bf} = \int dE_e P_M(T_m, E_e) n_H x_e x_p [1 + f(E_e - E_n)] \alpha_{nl}(E_e) - \int dE_e g(E_E - E_n) x_{nl} f(E_e - E_{nl}) \alpha_{nl}(E_E) / g_{nl}$$

- Bound-bound rate equation

$$\dot{x}_{nl}^{bb} = \sum_{n', l' = l \pm 1} (A_{nn'}^{ll'} (1 + f_{nn'}) x_{n', l'} - \frac{g_{n' l'}}{g_{nl}} f_{nn'} x_{nl}) P_{nn'}^{ll'}$$

THE MULTI-LEVEL ATOM (MLA)

- Two photon transitions between $n=1$ and $n=2$ are included:

$$\dot{x}_{2s \rightarrow 1s, 2\gamma} = -\dot{x}_{1s \rightarrow 2s, 2\gamma} = \Lambda_{2s}(-x_{2s} + x_{1s}e^{-E_{2s \rightarrow 1s}/T_\gamma})$$

- Net recombination rate:

$$x_e \simeq 1 - x_{1s} \rightarrow \dot{x}_e \simeq -\dot{x}_{1s} = -\dot{x}_{1s \rightarrow 2s} \\ + \sum_{n,l > 1s} A_{n1}^{l0} P_{n1}^{l0} \left\{ \frac{g_{nl}}{2} f_{n1}^+ x_{1s} - (1 + f_{n1}^+) x_{nl} \right\}$$

BOUND-BOUND RATE COEFFICIENTS

- Bound-bound rates given by Fermi's golden rule and matrix element

$$\rho(n'l', nl) = \int_0^\infty u_{n'l'}(r)u_{nl}(r)r^3 dr = \mathcal{C} \times \left[F_{2,1} \left(-n + l + 1, -n' + l, 2l, \frac{-4nn'}{(n - n')^2} \right) - \left(\frac{n - n'}{n + n'} \right)^2 F_{2,1} \left(-n + l - 1, -n' + l, 2l, \frac{-4nn'}{(n - n')^2} \right) \right]^2$$

- Power-series destabilizes at high-n, recursion relation used
- Rates are calculated, tabulated, and stored

BB RATE COEFFICIENTS: VERIFICATION

- WKB estimate of matrix elements $\rho(n'l', nl) = a_0 n^2 \int_{-\pi}^{\pi} d\tau e^{i\Omega\tau} (1 + \cos\eta)$

$$\Omega = \omega_n - \omega_{n'}$$

$$r = r_{\max} (1 + \cos \eta) / 2$$

$$\tau = \eta + \sin \eta$$

Fourier transform of classical orbit!
Application of correspondence
principle!

$$\rho^{\text{dipole}}(n, l, n', l') = \frac{n_c^2}{s} \left\{ J_{s-1}(s\epsilon) - \frac{1 \mp \sqrt{1 - \epsilon^2}}{\epsilon} J_s(s\epsilon) \right\}$$

$$\epsilon = \left(1 - \frac{l(l+1)}{n^2} \right)^{1/2}$$

$$s = n - n'$$

- Radial matrix elements checked against WKB (10%), published rates of Brocklehurst (1971), Green, Rush, and Chandler (1967) (agreement to their published 4 digits)

BOUND-FREE RATES

- Using continuum wave functions, bound-free rates are obtained (Burgess 1957)

- Bound-free matrix elements satisfy a convenient recursion relation:

$$\rho(n, l, \kappa, l') \equiv \sqrt{\frac{(n+l)!}{(n-l-1)!} \prod_{s=0}^{l'} (1 + s^2 \kappa^2)} (2n)^{l-n} G(n, l, \kappa, n) \quad \kappa^2 \equiv K_e / \text{Ryd}$$

$$G(n, l-2, \kappa, l-1) = [4n^2 - 4l^2 + l(2l-1)(1 + n^2 \kappa^2)] G(n, l-1, \kappa, l) \\ - 4n^2(n^2 - l^2) [1 + (l+1)^2 \kappa^2] G(n, l, \kappa, l+1)$$

- For each n, dipole BF rates tabulated for 550 values of κ in 11 logarithmic bins from $n^2 \kappa^2 = 10^{-10} \rightarrow 4.96 \times 10^8$

- Matrix elements compared with Burgess 1965 (5 digits) and with WKB approximation (5%):

$$\rho(n, l, \kappa, l \pm 1) \simeq \frac{l^2}{\pi \sqrt{3} u n^{3/2}} \{ K_{2/3}(ul^3/3) \pm K_{1/3}(ul^3/3) \}$$

$$u = \frac{1}{2}(\kappa^2 + \frac{1}{n^2})$$

- At each temperature, thermal recombination/ionization rates obtained using 11-point Newton-Cotes formula, agreement with Burgess to 4 published digits

RADIATION FIELD: BLACK BODY+

- Escape probability treated in Sobolev approx.

$$P_{n,n'}^{l,l'} = \frac{1 - e^{-\tau_s}}{\tau_s}$$

$$\tau_s = \frac{c^3 n_H}{8\pi H \nu_{nn'}^3} A_{nn'}^{ll'} \left[\frac{g_{n'}^{l'}}{g_n^l} x_n^l - x_{n'}^{l'} \right]$$

$$\mathcal{R}(\nu, \nu') = \phi(\nu)\phi(\nu') \quad \frac{v_{\text{th}}}{H(z)} \ll \lambda$$

- Excess line photons injected into radiation field

$$\left(\frac{8\pi \nu_{nn'}^3}{c^3 n_H} \right) (f_{nn'}^+ - f_{nn'}^-) = A_{nn'}^{ll'} P_{nn'}^{ll'} \left[x_n^l (1 + f_{nn'}^+) - \frac{g_n^l}{g_{n'}^{l'}} x_{n'}^{l'} f_{nn'}^+ \right]$$

- Photons are conserved outside of line regions

$$f_{n1}^{+10} = f_{n+1,1}^{-10} \left[\frac{1 - (n+1)^{-2}}{1 - n^{-2}} (1+z) - 1 \right]$$

RADIATION FIELD: BLACK BODY+

- Escape probability treated in Sobolev approx.

$$P_{n,n'}^{l,l'} = \frac{1 - e^{-\tau_s}}{\tau_s}$$

$$\tau_s = \frac{c^3 n_H}{8\pi H \nu_{nn'}^3} A_{nn'}^{ll'} \left[\frac{g_{n'}^{l'}}{g_n^l} x_n^l - x_{n'}^{l'} \right]$$

$$\mathcal{R}(\nu, \nu') = \phi(\nu)\phi(\nu')$$

- Ali-Haimoud, Hirata, and Forbes are solving FP eqn. to obtain evolution of $f(\nu)$ more generally, including atomic recoil/diffusion, 2γ decay and full time-dependence of problem, coherent and incoherent scattering, overlap of higher-order Lyman lines

STEADY-STATE APPROXIMATION FOR EXCITED STATES

- Evolution equations may be re-written in matrix form

$$\frac{d\vec{x}}{dt} = \mathbf{R}\vec{x} + \vec{s}$$

STEADY-STATE APPROXIMATION FOR EXCITED STATES

- Evolution equations may be re-written in matrix form

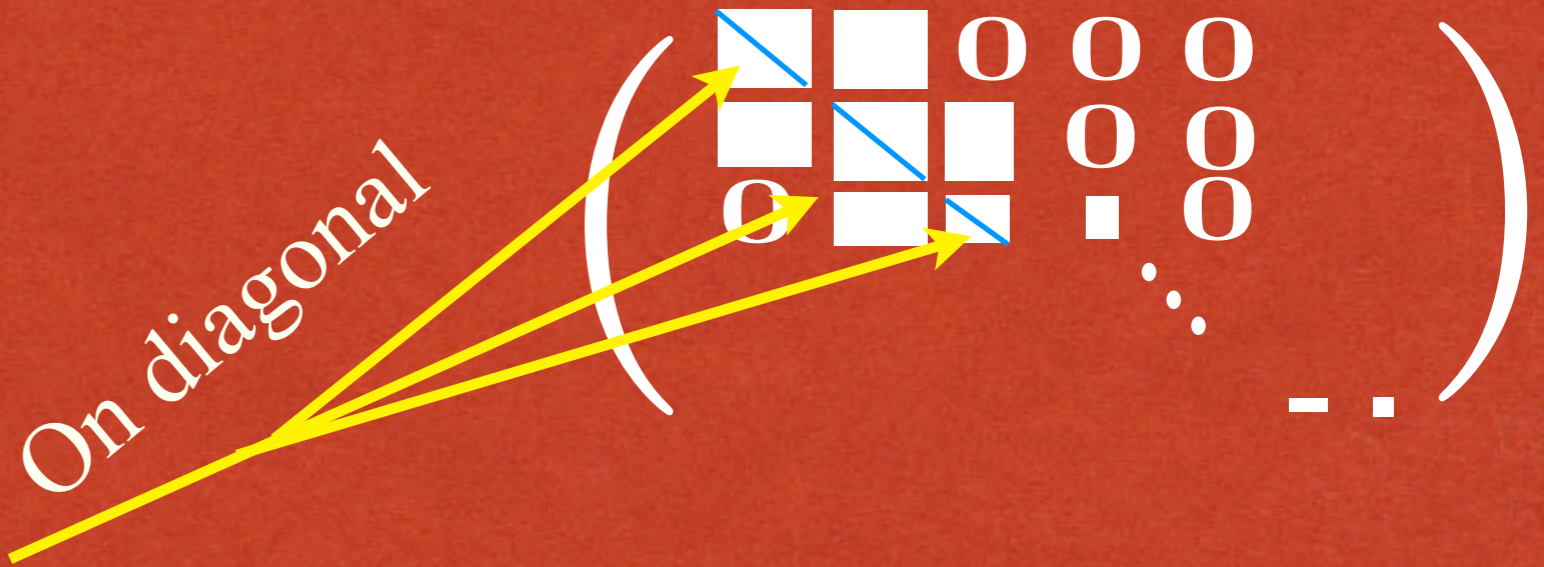

$$\frac{d\vec{x}}{dt} = \mathbf{R}\vec{x} + \vec{s}$$

$$\vec{x} = \begin{pmatrix} \vec{x}_0 \\ \vec{x}_1 \\ \dots \\ \vec{x}_{n_{\max}-1} \end{pmatrix}$$

STEADY-STATE APPROXIMATION FOR EXCITED STATES

- Evolution equations may be re-written in matrix form

$$\frac{d\vec{x}}{dt} = \mathbf{R}\vec{x} + \vec{s}$$

For state 1, includes BB transitions out of 1 to all other l'' , photo-ionization, 2γ transitions to ground state

STEADY-STATE APPROXIMATION FOR EXCITED STATES

- Evolution equations may be re-written in matrix form

$$\frac{d\vec{x}}{dt} = \mathbf{R}\vec{x} + \vec{s}$$

Off diagonal

$$\begin{pmatrix} \blacksquare & \blacksquare & 0 & 0 & 0 \\ \blacksquare & \blacksquare & 0 & 0 & 0 \\ 0 & \blacksquare & \blacksquare & 0 & 0 \\ \vdots & \vdots & \vdots & \ddots & \ddots \end{pmatrix}$$

For state 1, includes BB transitions into 1 from all other 1'

STEADY-STATE APPROXIMATION FOR EXCITED STATES

- Evolution equations may be re-written in matrix form

$$\frac{d\vec{x}}{dt} = \mathbf{R}\vec{x} + \vec{s}$$

- Includes recombination to 1,
1 and 2γ transitions from ground state

STEADY-STATE APPROXIMATION FOR EXCITED STATES

- Evolution equations may be re-written in matrix form

$$\frac{d\vec{x}}{dt} = \mathbf{R}\vec{x} + \vec{s}$$

- For $n > 1$, $t_{\text{rec}}^{-1} \sim 10^{-12} \text{ s}^{-1} \ll \mathbf{R}$, $\vec{s} \rightarrow -\vec{x} \simeq \mathbf{R}^{-1} \vec{s}$
 $\mathbf{R} \lesssim 1 \text{ s}^{-1}$ (e.g. Lyman- α)

RAPID MATRIX INVERSION: SPARSITY TO THE RESCUE

- Matrix is $\approx n_{\max}^2 \times n_{\max}^2$
- Brute force would require $n_{\max}^6 \approx 1000$ s for $n_{\max} = 200$ for a single time step

- Sparsity to the rescue $\Delta l = \pm 1$

$$M_{l,l-1} \vec{x}_{l-1} + M_{l,l} \vec{x}_l + M_{l,l+1} \vec{x}_{l+1} = \vec{s}_l$$

$$\vec{v}_l = \chi_l \left[\vec{s}_l - \mathbf{M}_{1,1+1} \vec{v}_l + \sum_{l'=l-1}^0 \sigma_{l,l'} \vec{s}_{l'} (-1)^{l'-l} \right]$$

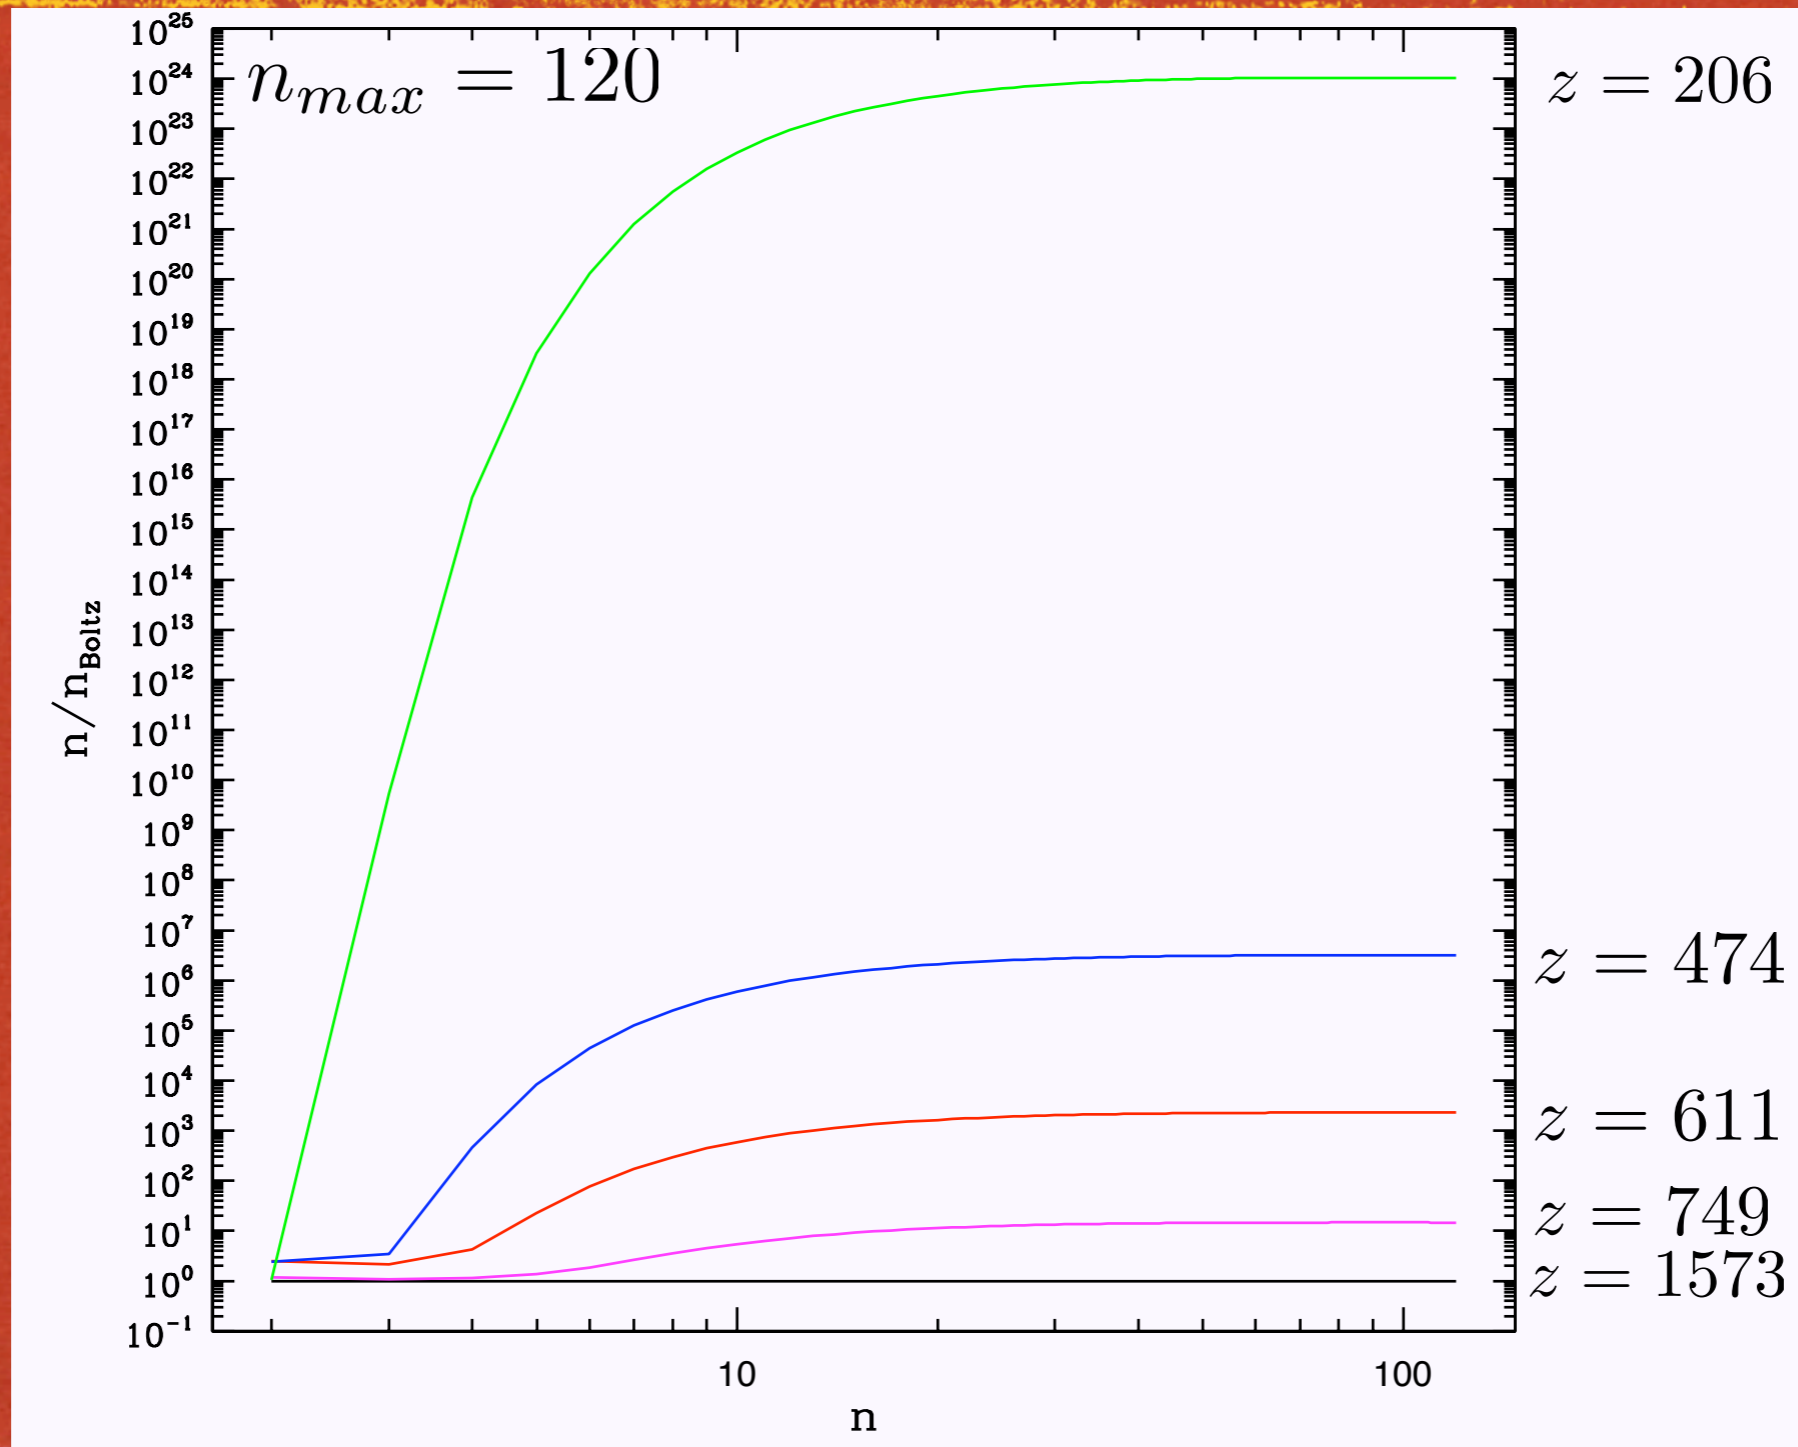

$$\chi_l = \begin{cases} \mathbf{M}_{00}^{-1} & \text{if } l = 0 \\ (\mathbf{M}_{l+1,l+1} - \mathbf{M}_{l+1,l} \chi_l \mathbf{M}_{l,l+1})^{-1} & \text{if } l > 0 \end{cases} \quad \begin{aligned} \sigma_{l,l-1} &= \mathbf{M}_{l,l-1} \chi_{l-1} \\ \sigma_{l,i} &= \sigma_{l,i+1} \mathbf{M}_{i+1,i} \chi_i \end{aligned}$$

SOME COMPUTATIONAL NOTES

- Ingredients incorporated into user-friendly code (RecSparse) which outputs $x(z)$ for all times and atomic populations at several chosen slices.
- Collisions neglected for time being
- LAPACK libraries used for inversion of submatrices
- Simple rk4 ode solver used (inopportune for a stiff set of equations)
- Checked on MLA code of Hirata et al. with higher level two-photon transitions turned off and dense time grid (19548 steps in dl_{na} going from $z=1606$ to $z=700$), agreement to several parts in 10^5 , with and without feedback

DEVIATIONS FROM BOLTZMANN EQ: HIGH-N

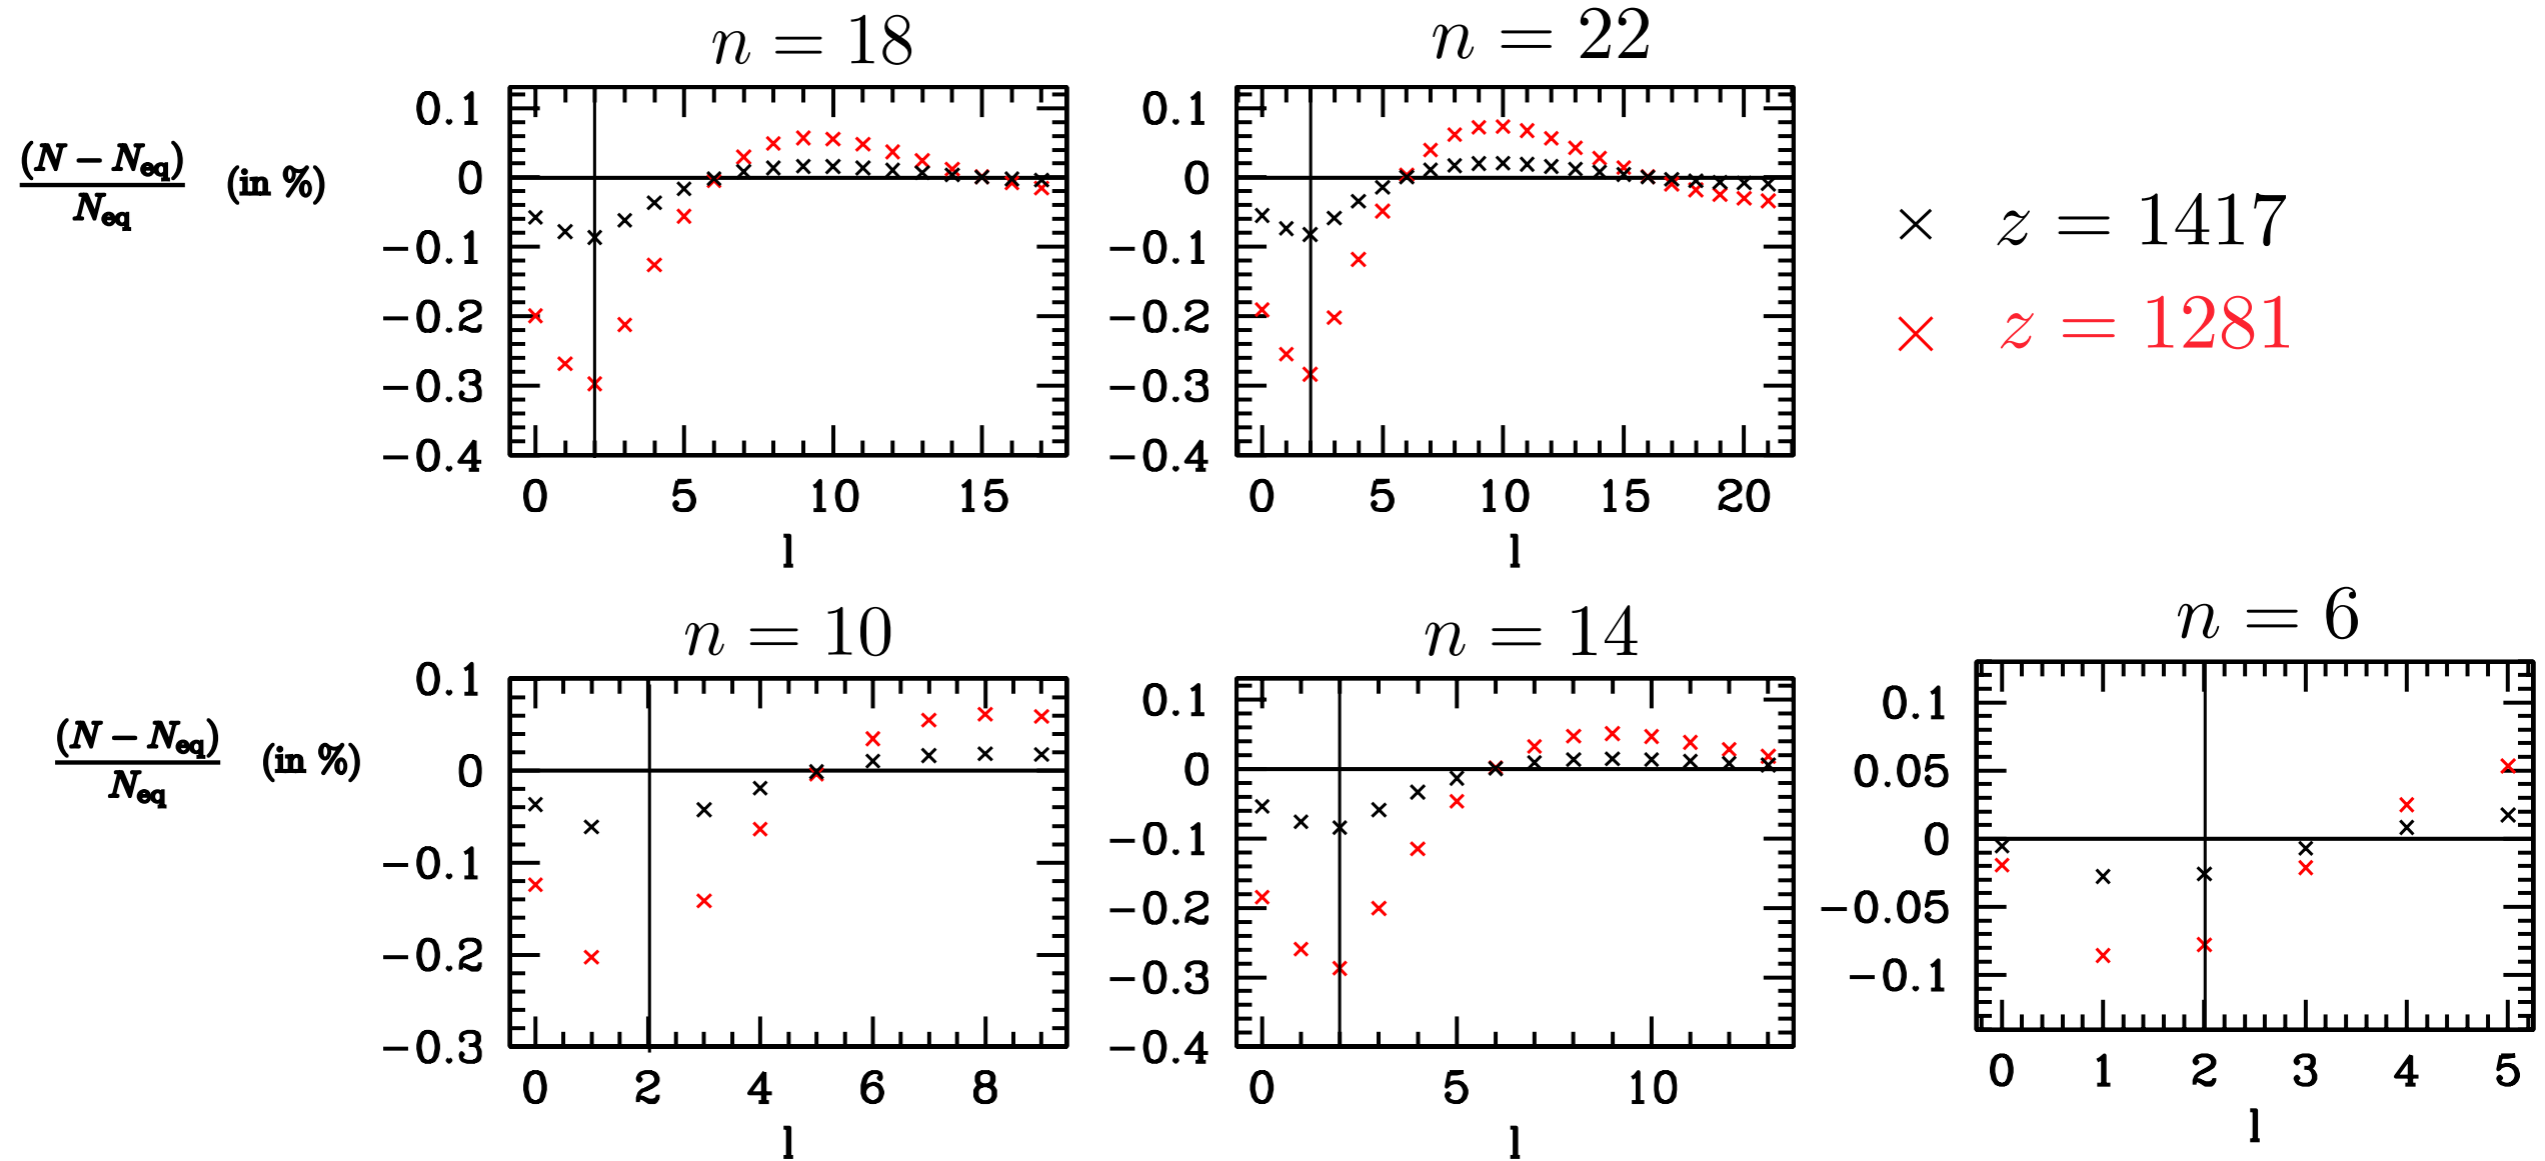

- $\alpha n \gtrsim A_{\text{bb,down}}$.

DEVIATIONS FROM BOLTZMANN EQ: l-substates

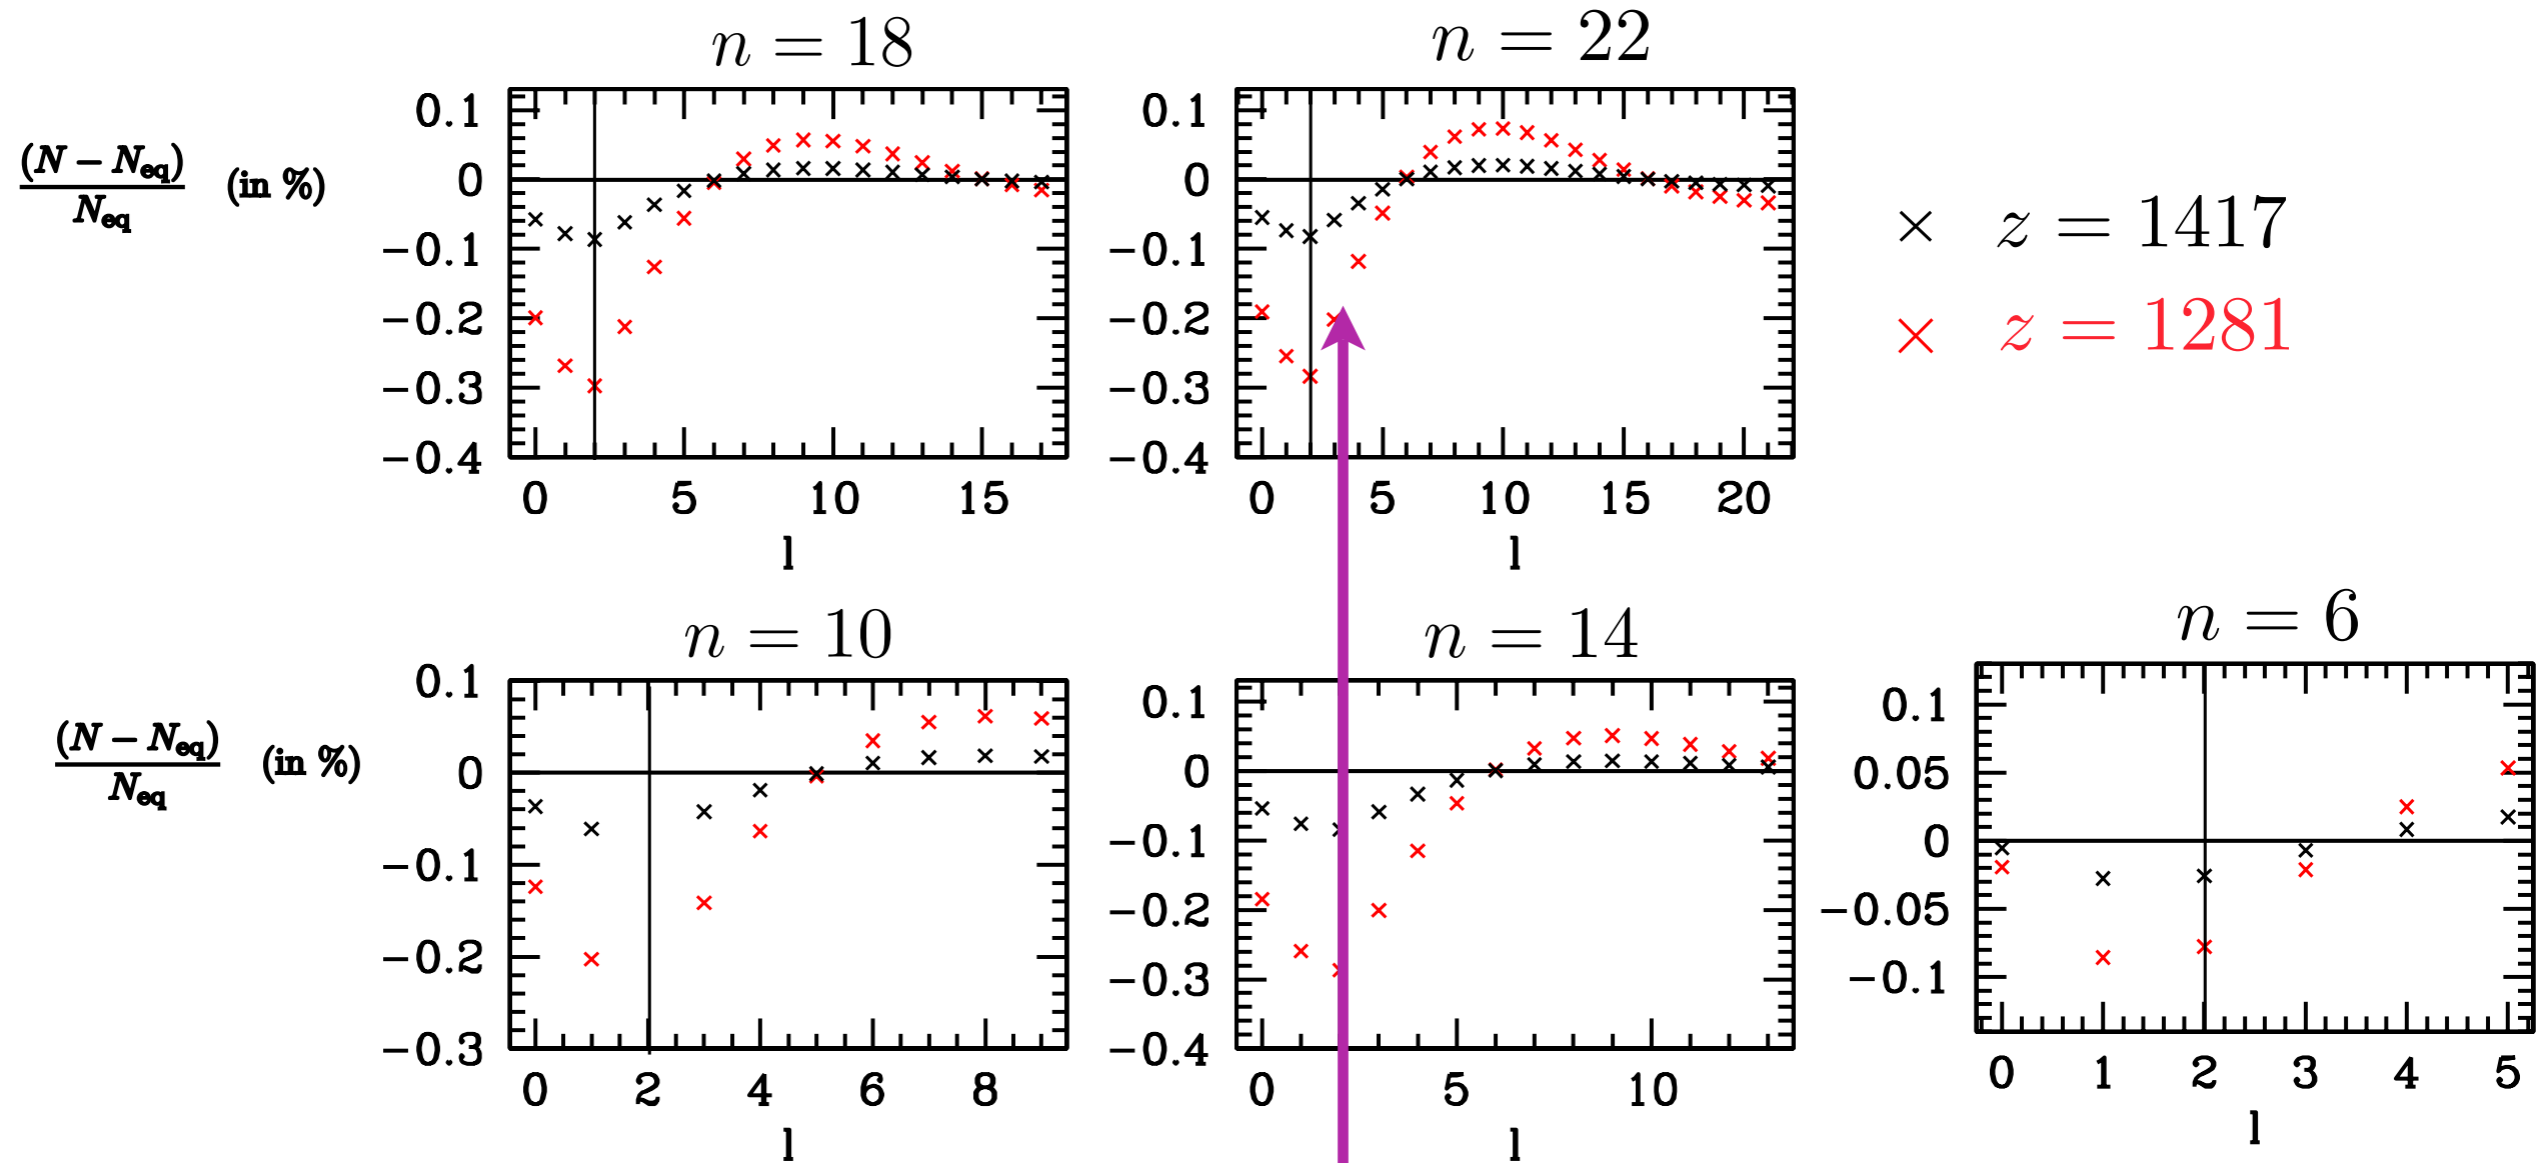

RecSparse results

$$n_{\max} = 30$$

DEVIATIONS FROM BOLTZMANN EQ: I-substates

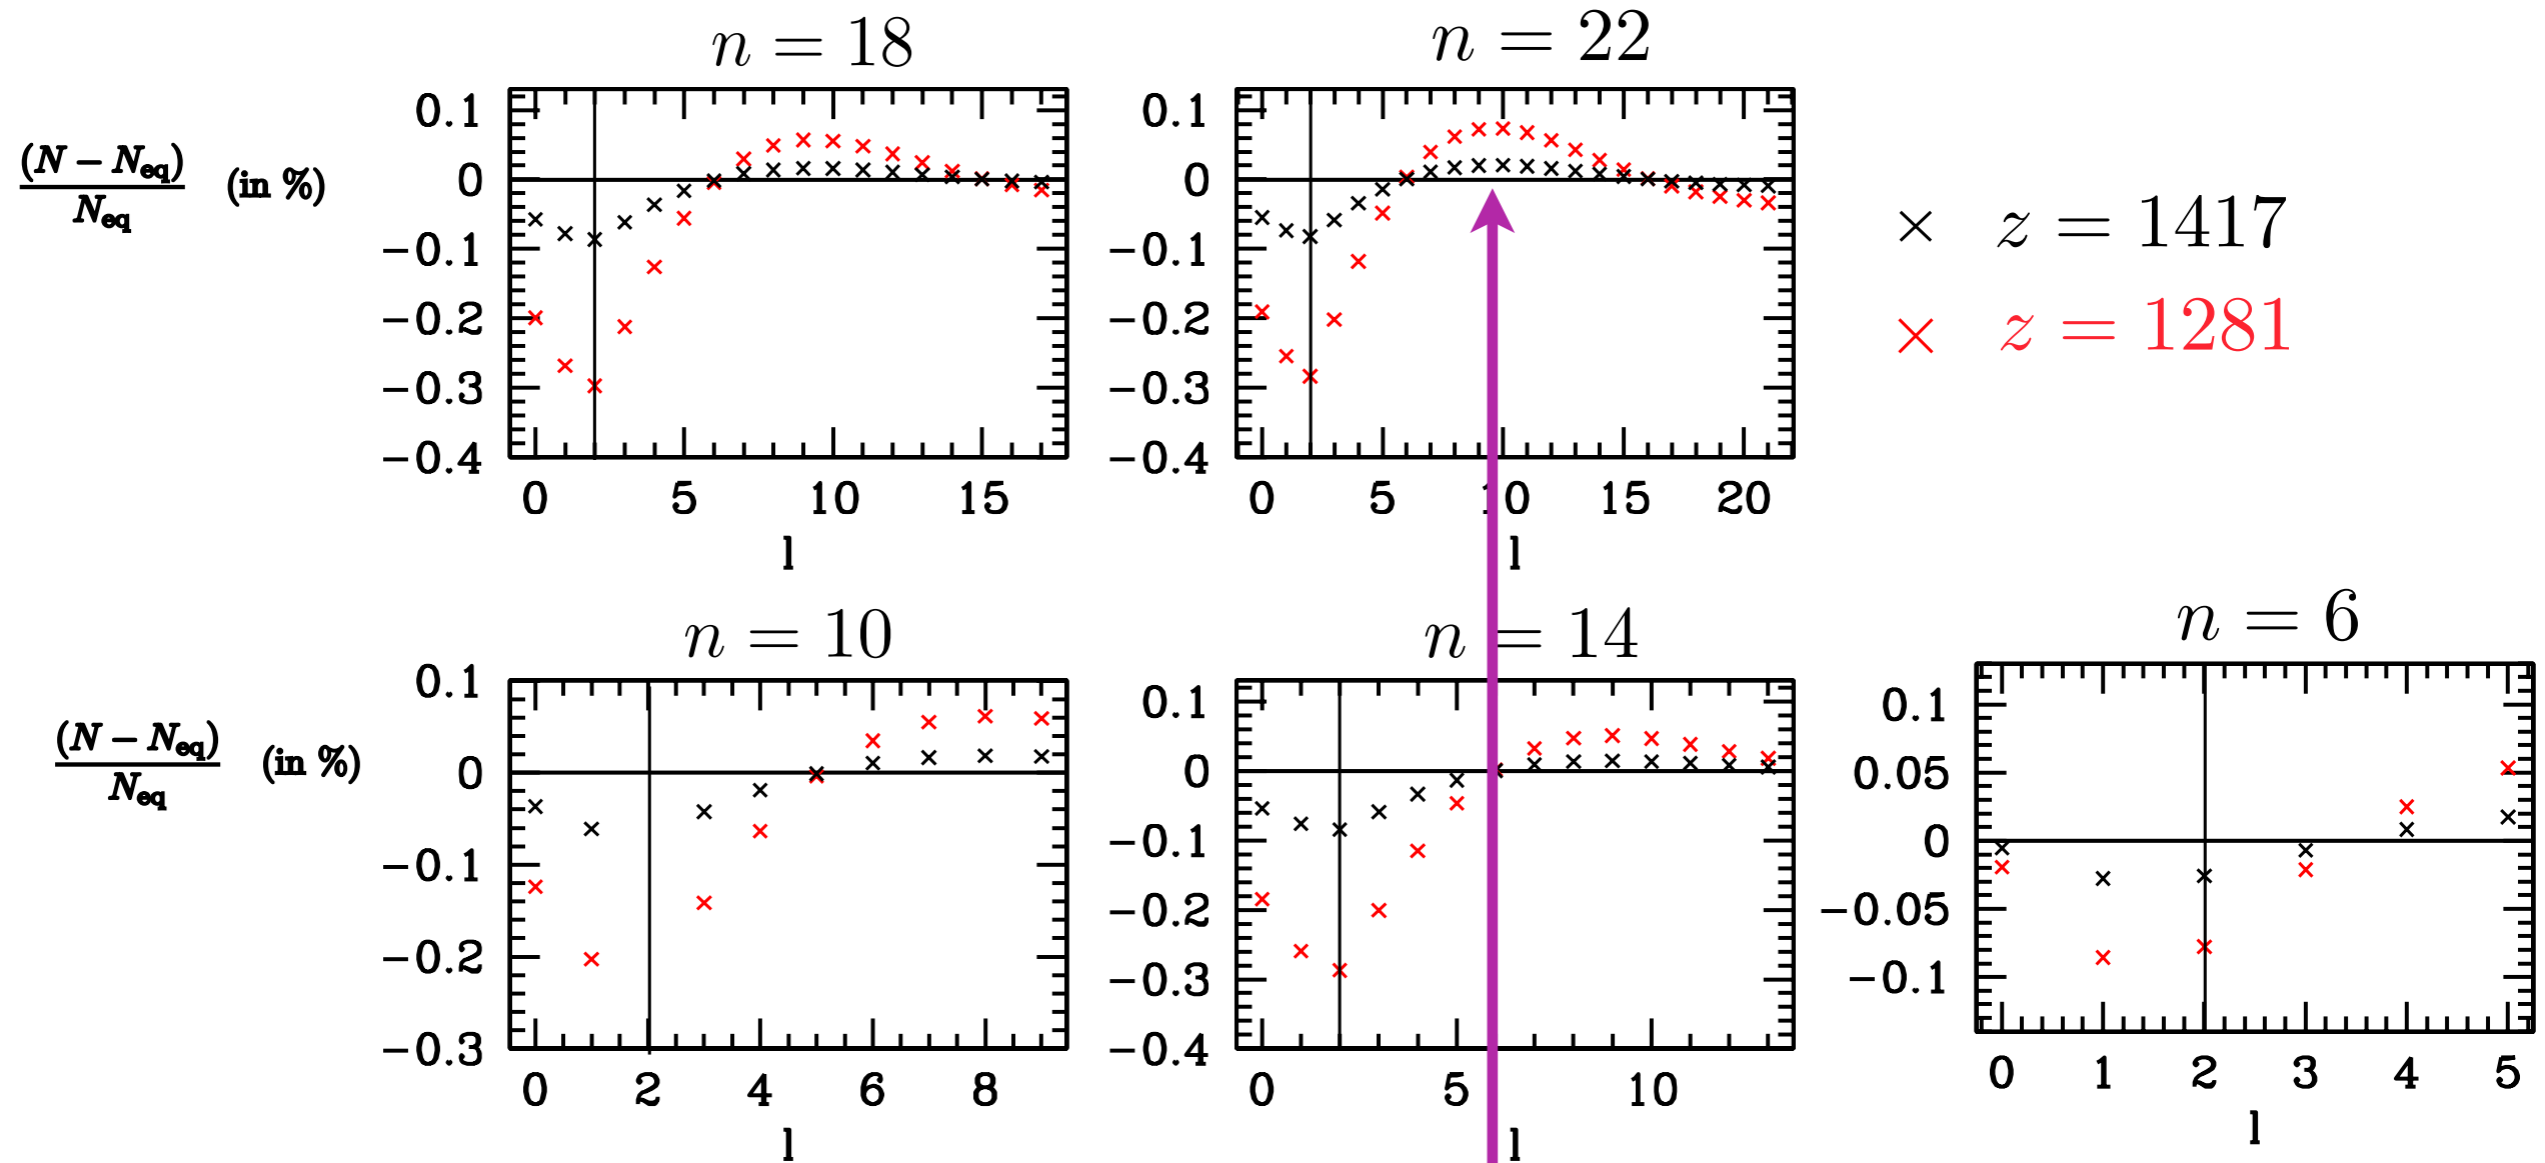

RecSparse results $n_{\max} = 30$

Lower l states can easily cascade down, and are relatively under-populated

DEVIATIONS FROM BOLTZMANN EQ: I-substates

RecSparse results $n_{\max} = 30$

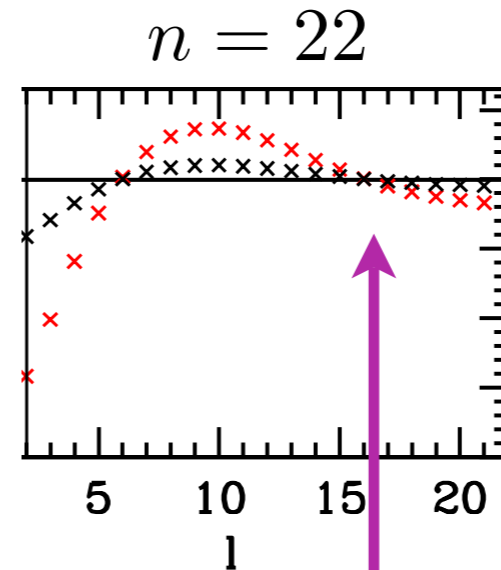

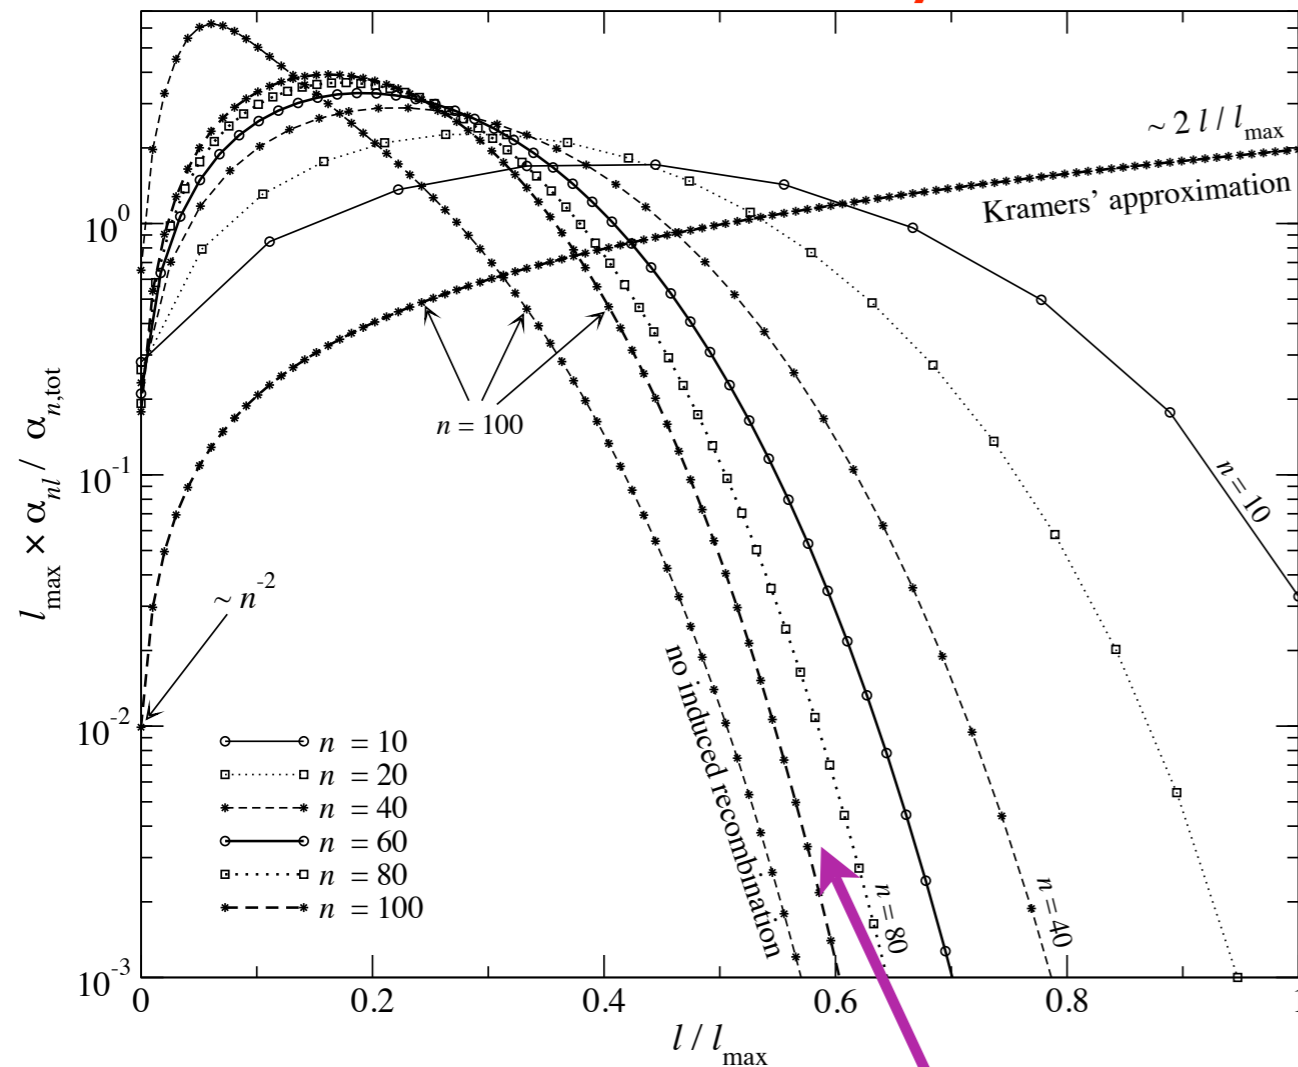

Higher l states can't easily cascade down, and are relatively over-populated

DEVIATIONS FROM BOLTZMANN EQ: I-substates

RecSparse results

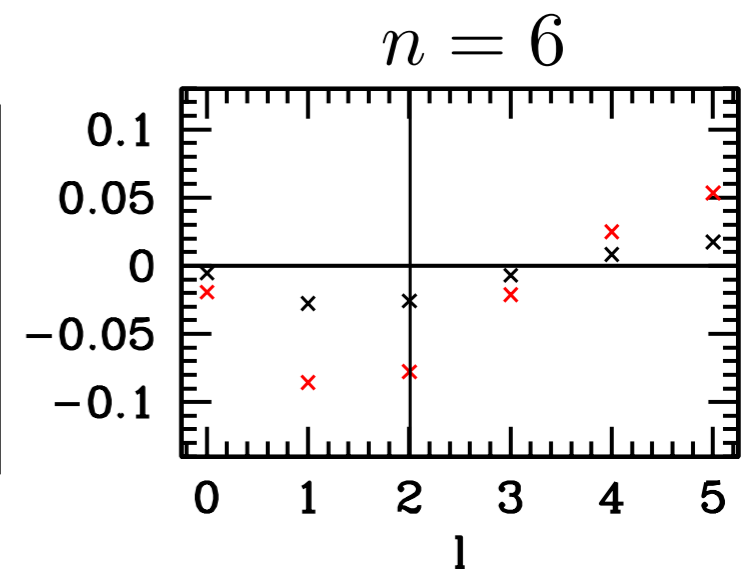

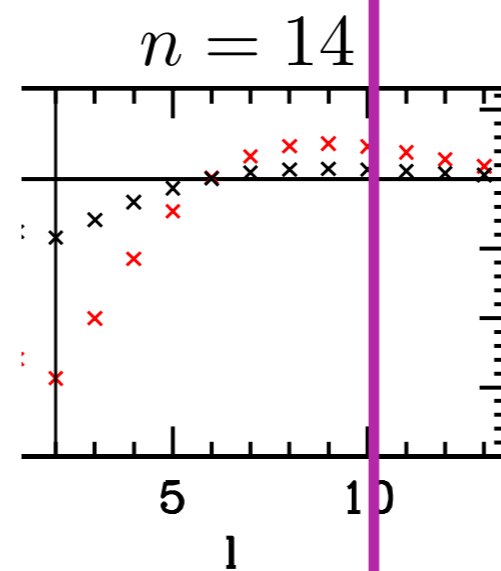

$$n_{\max} = 30$$

Chluba/Rubino-Martin/Sunyaev 2006

$\times \quad z = 1417$

$\times \quad z = 1281$

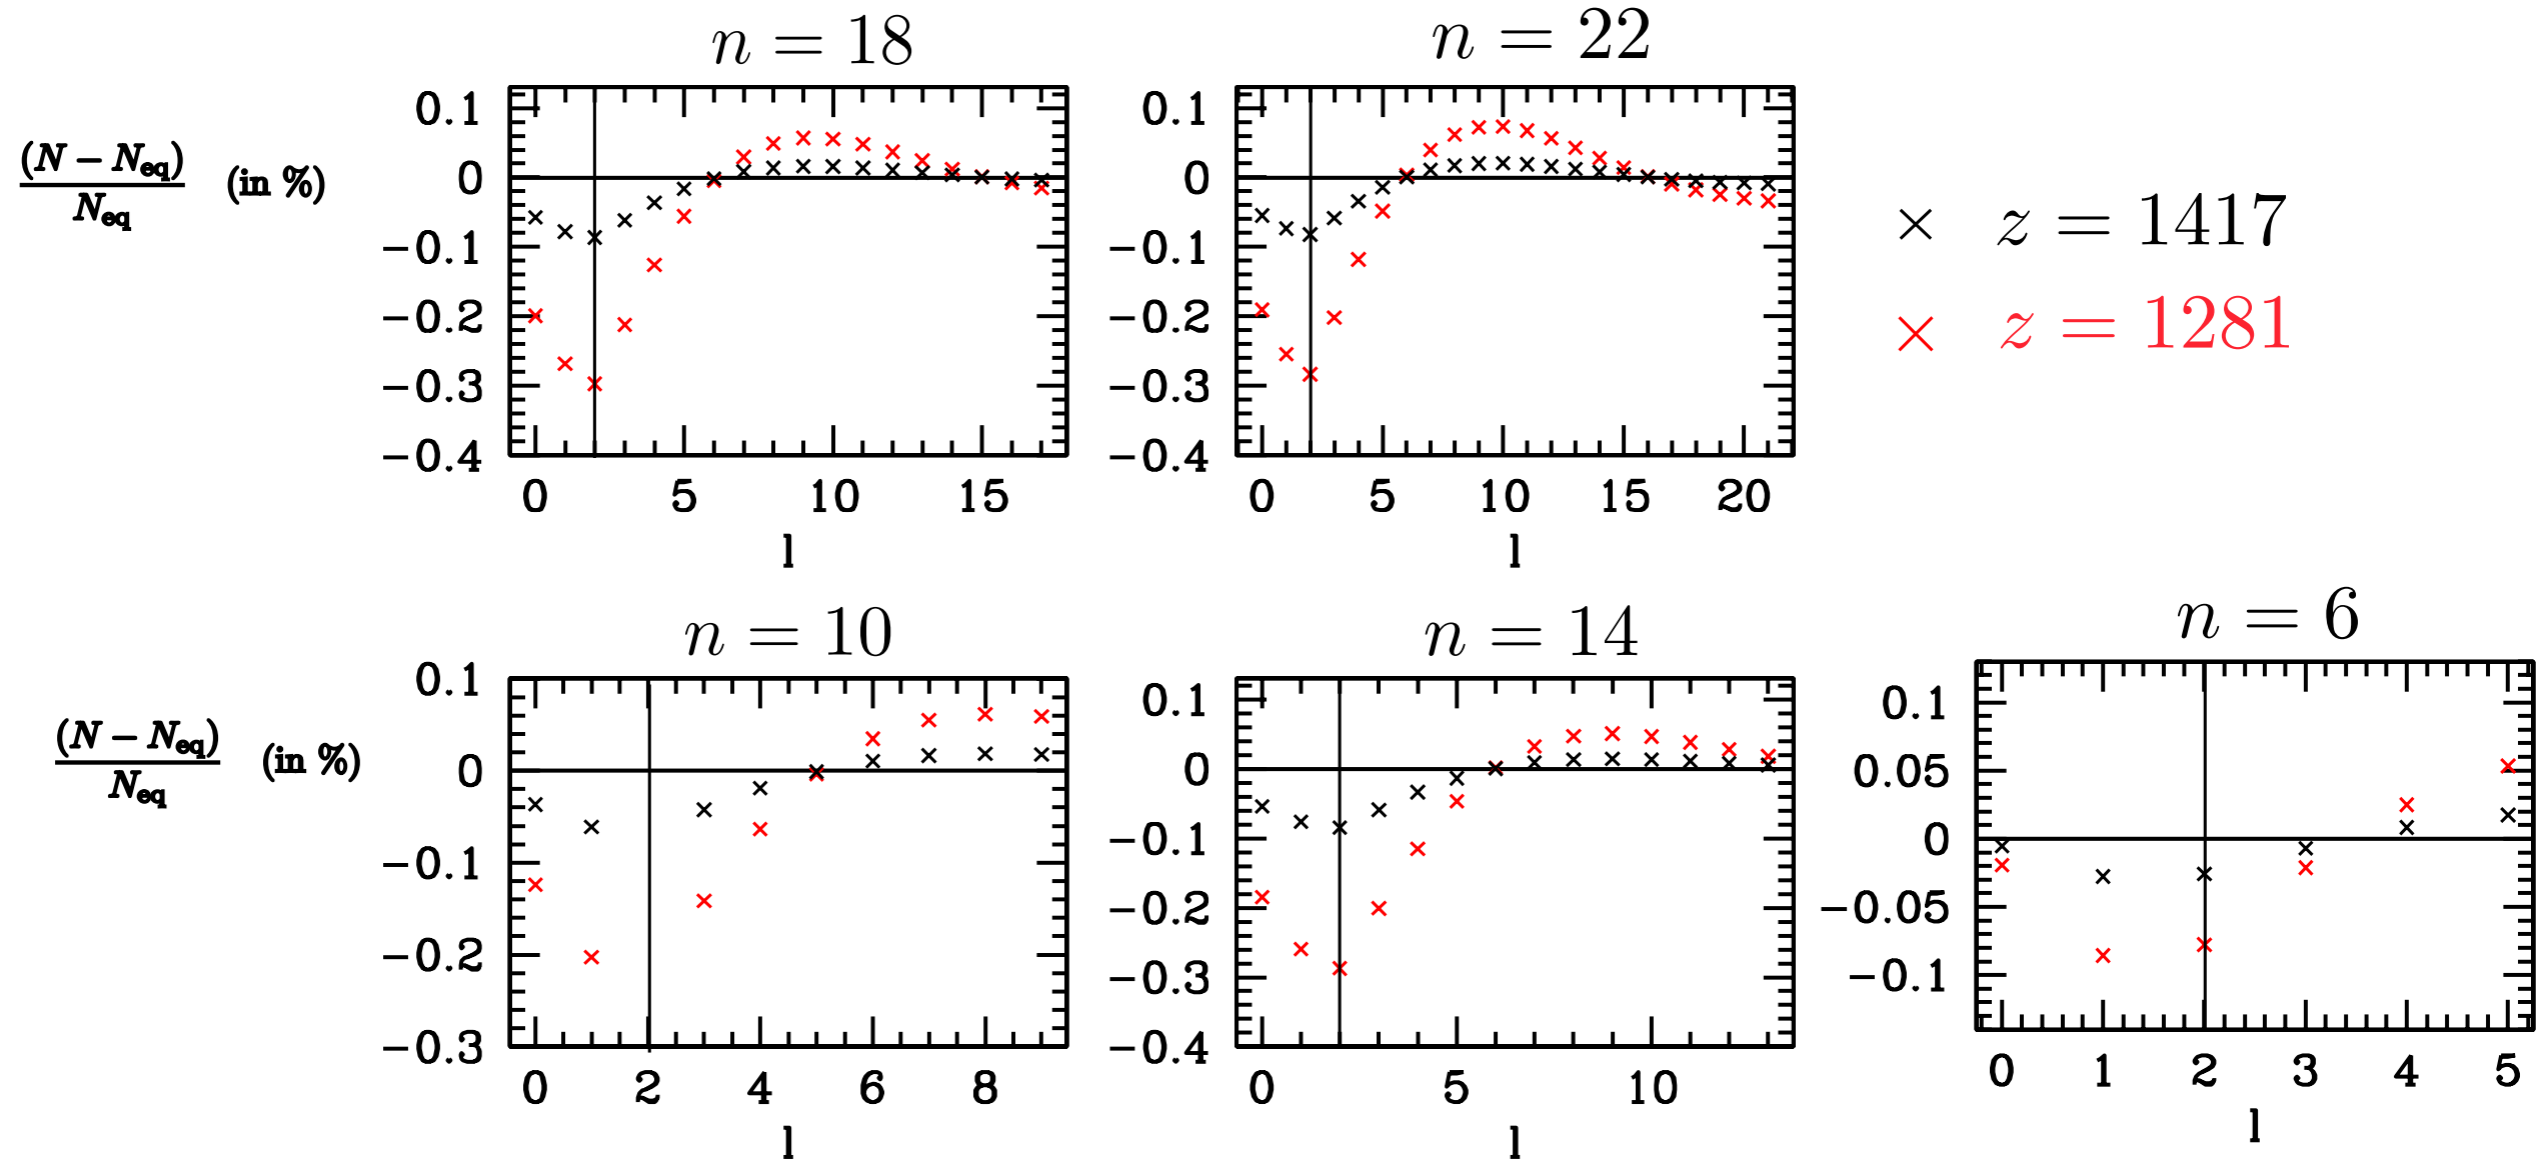

Highest l states recombine inefficiently, and are relatively under-populated

DEVIATIONS FROM BOLTZMANN EQ: l-substates

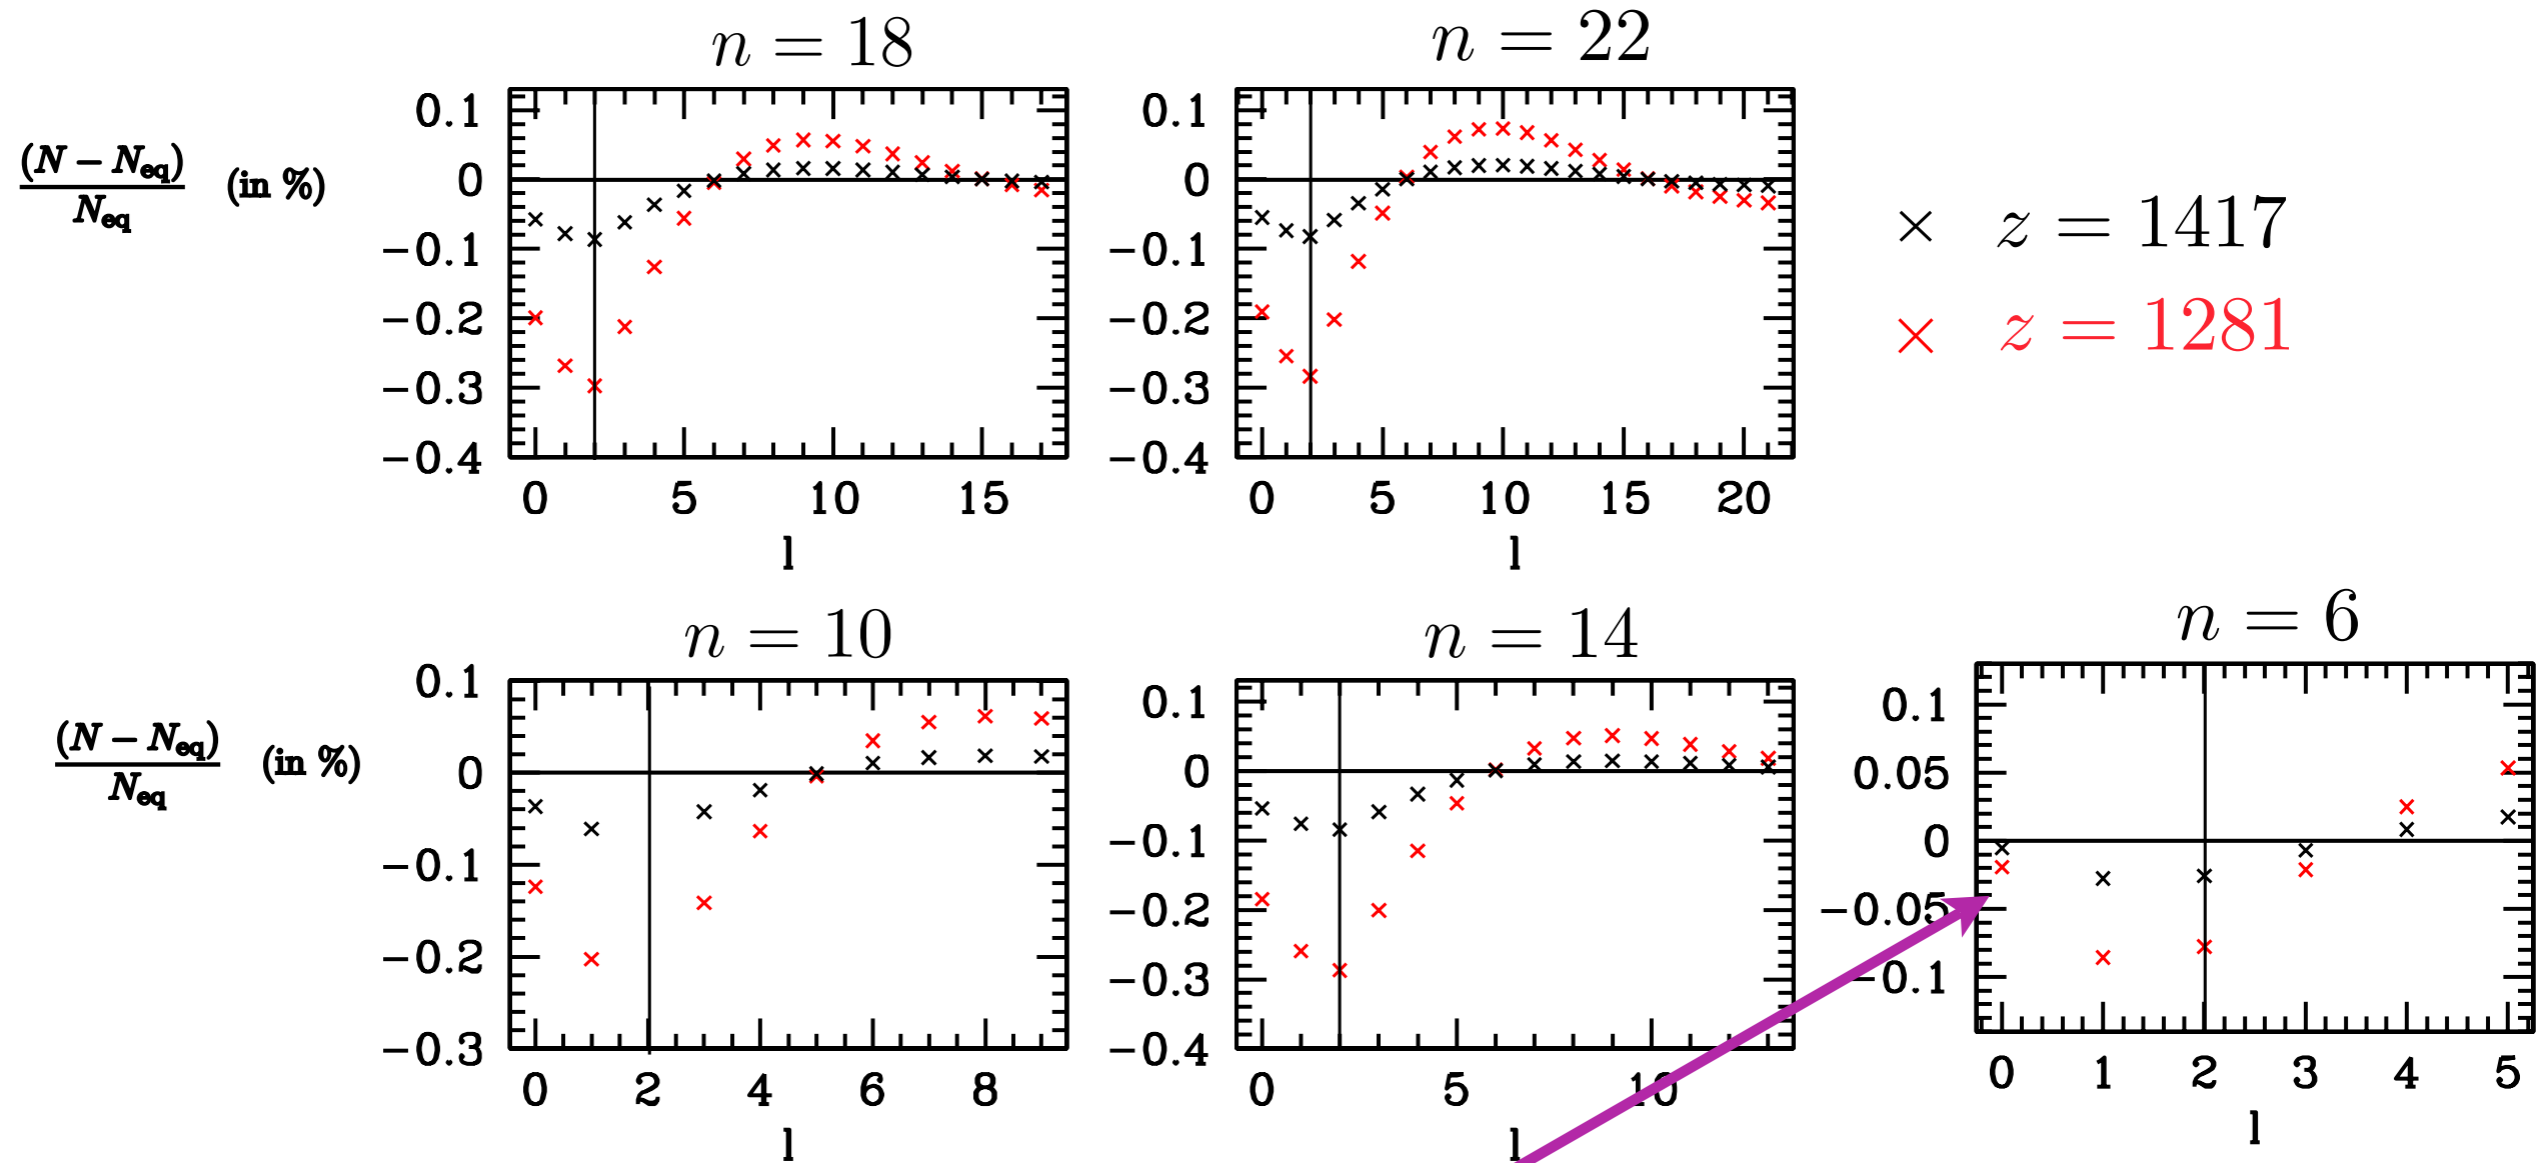

RecSparse results

$$n_{\max} = 30$$

DEVIATIONS FROM BOLTZMANN EQ: l-substates

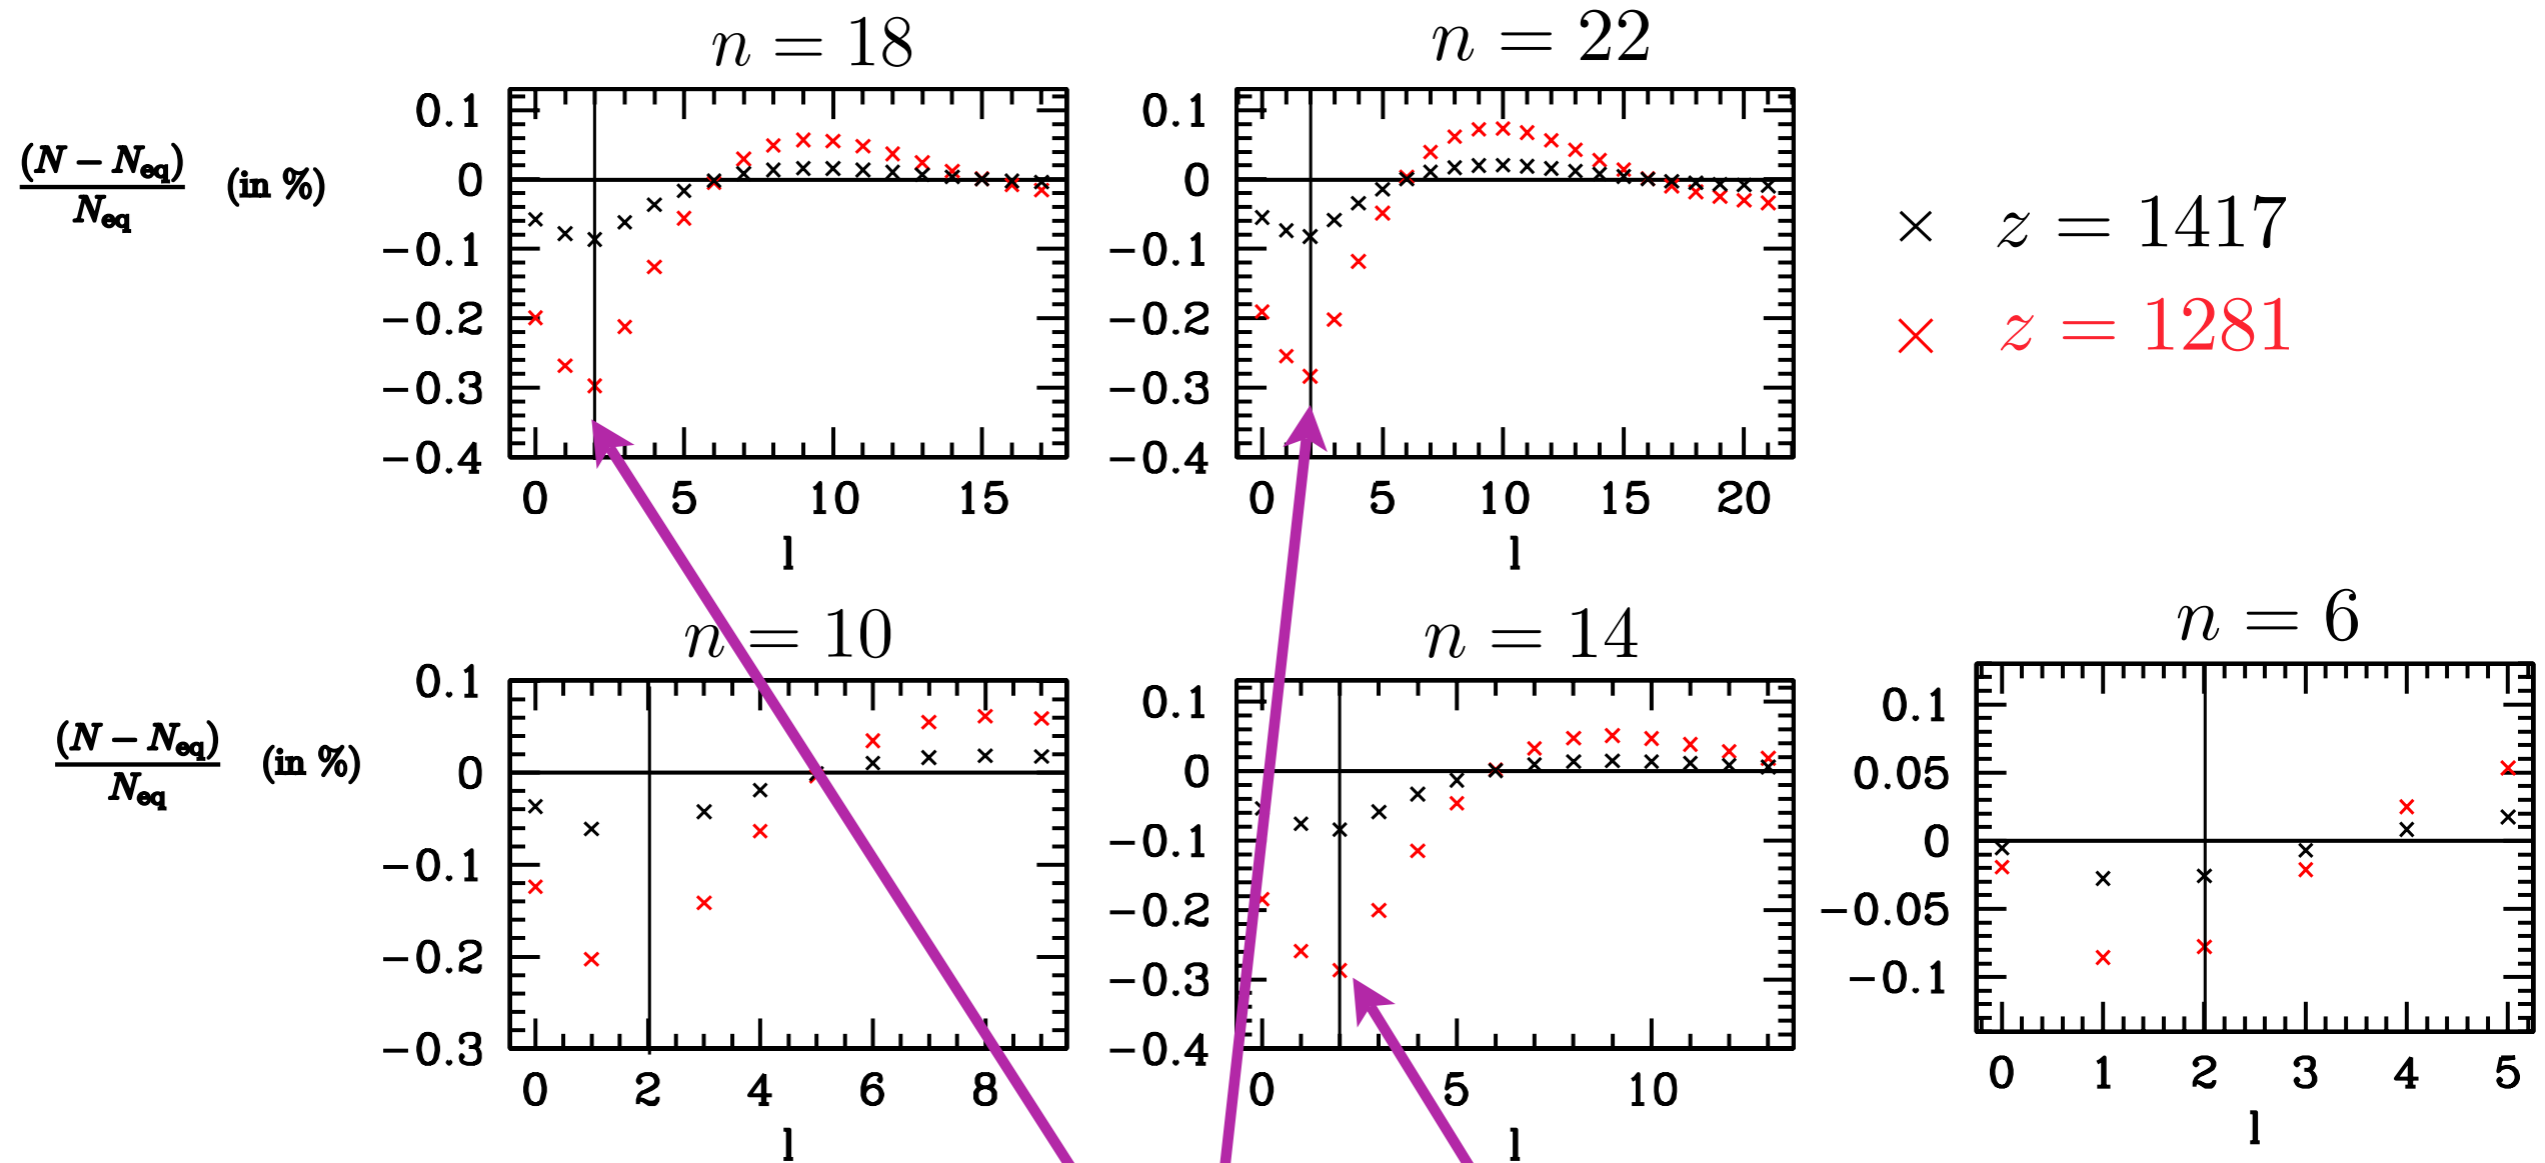

RecSparse results $n_{\max} = 30$

$l=0$ can't cascade down, so s states are not as under-populated

DEVIATIONS FROM BOLTZMANN EQ: I-substates

RecSparse results $n_{\max} = 30$

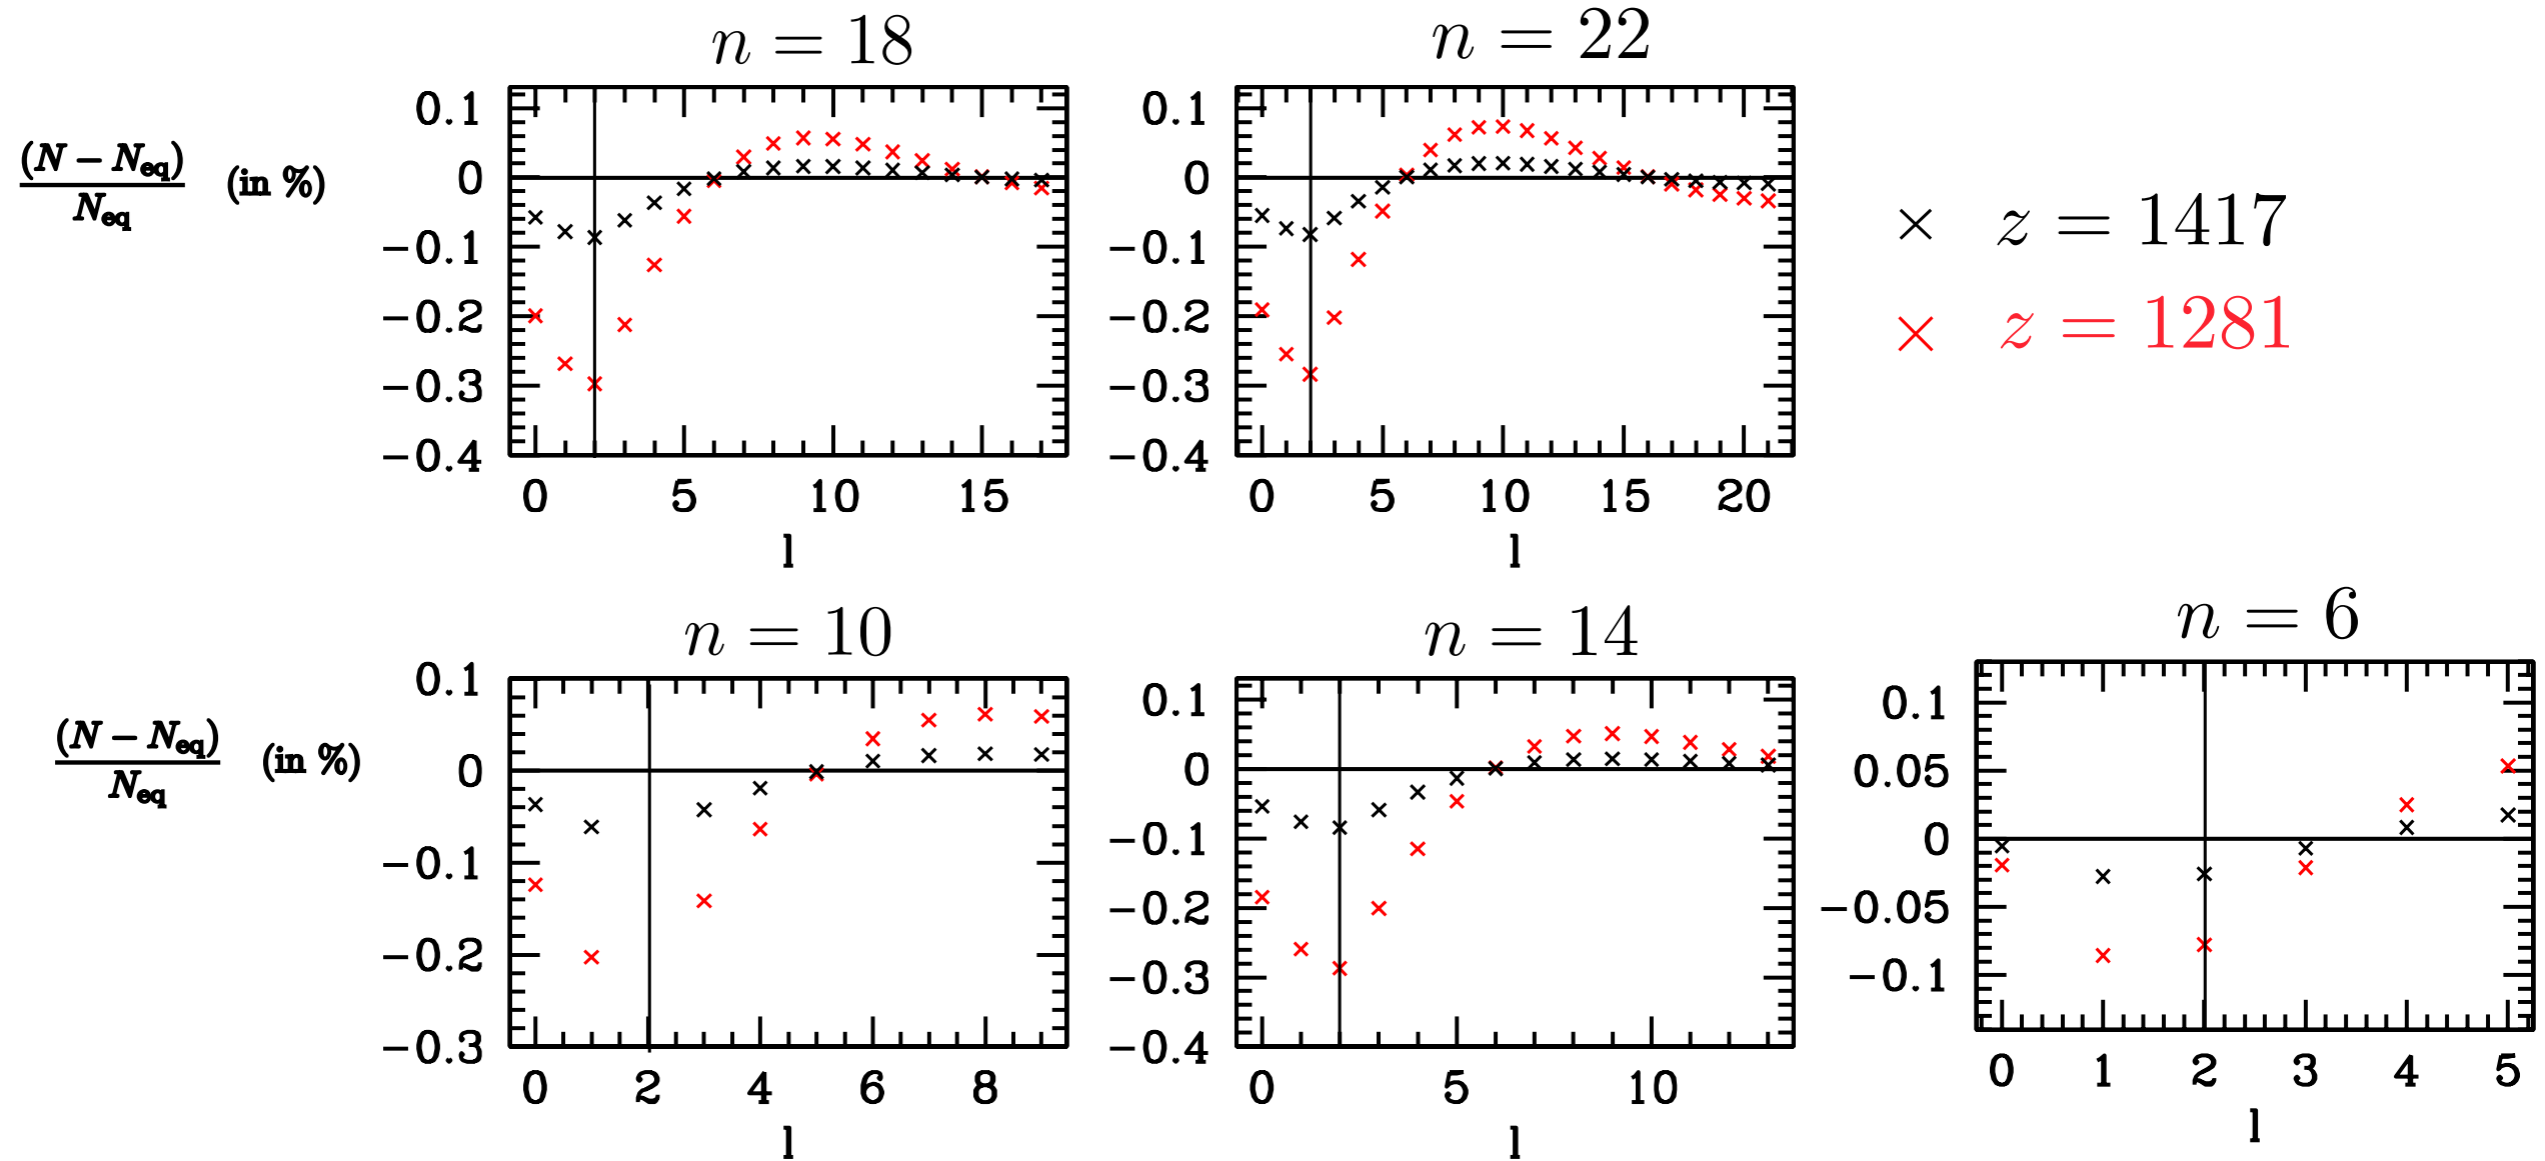

Why the feature at $l=2$?

DEVIATIONS FROM BOLTZMANN EQ: l-substates

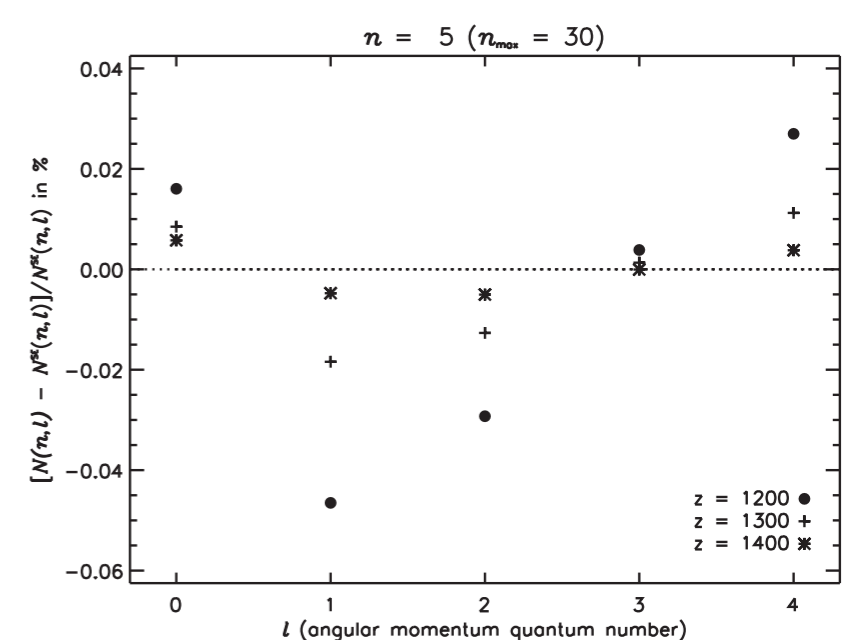

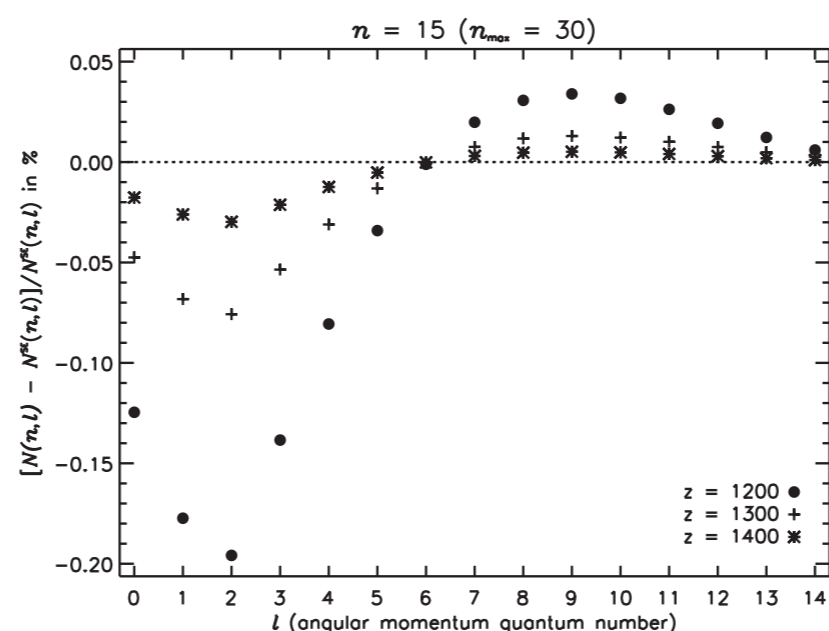

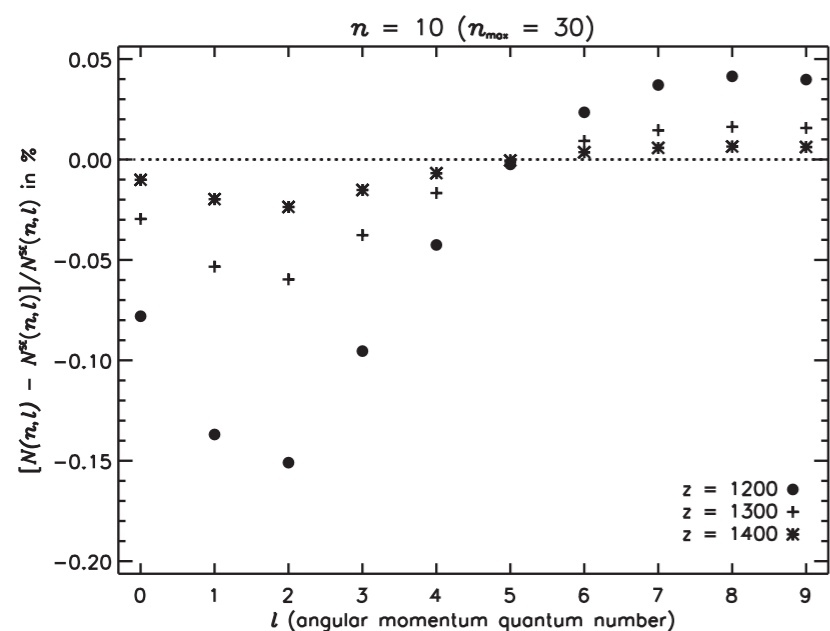

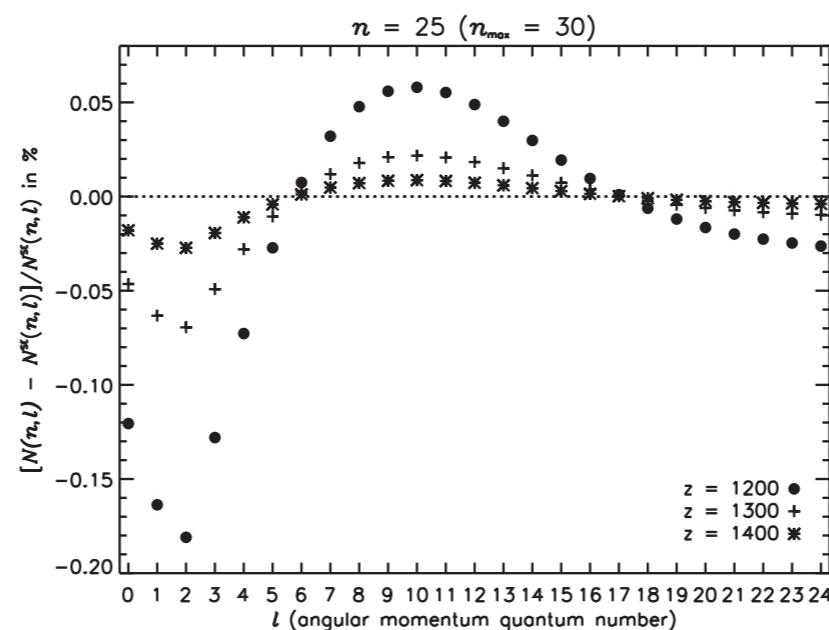

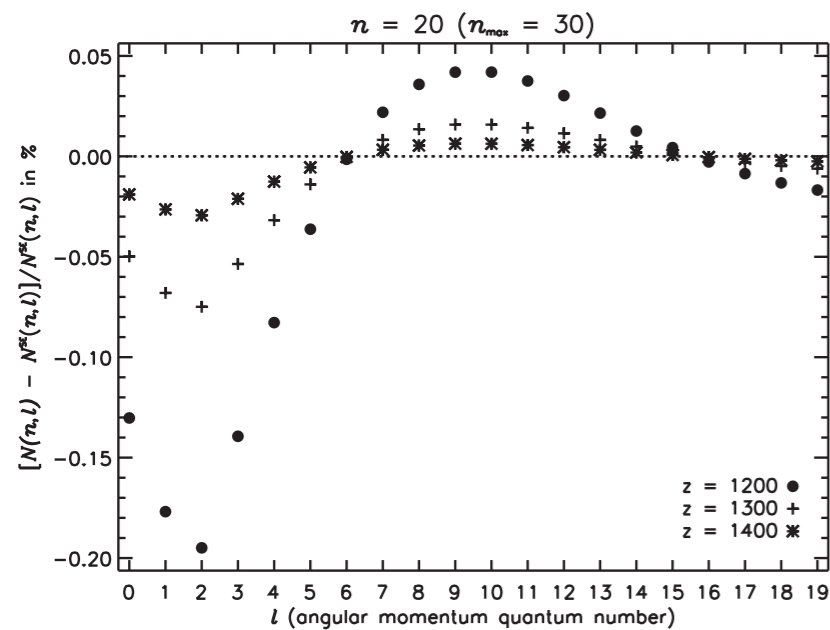

RecSparse results

$$n_{\max} = 30$$

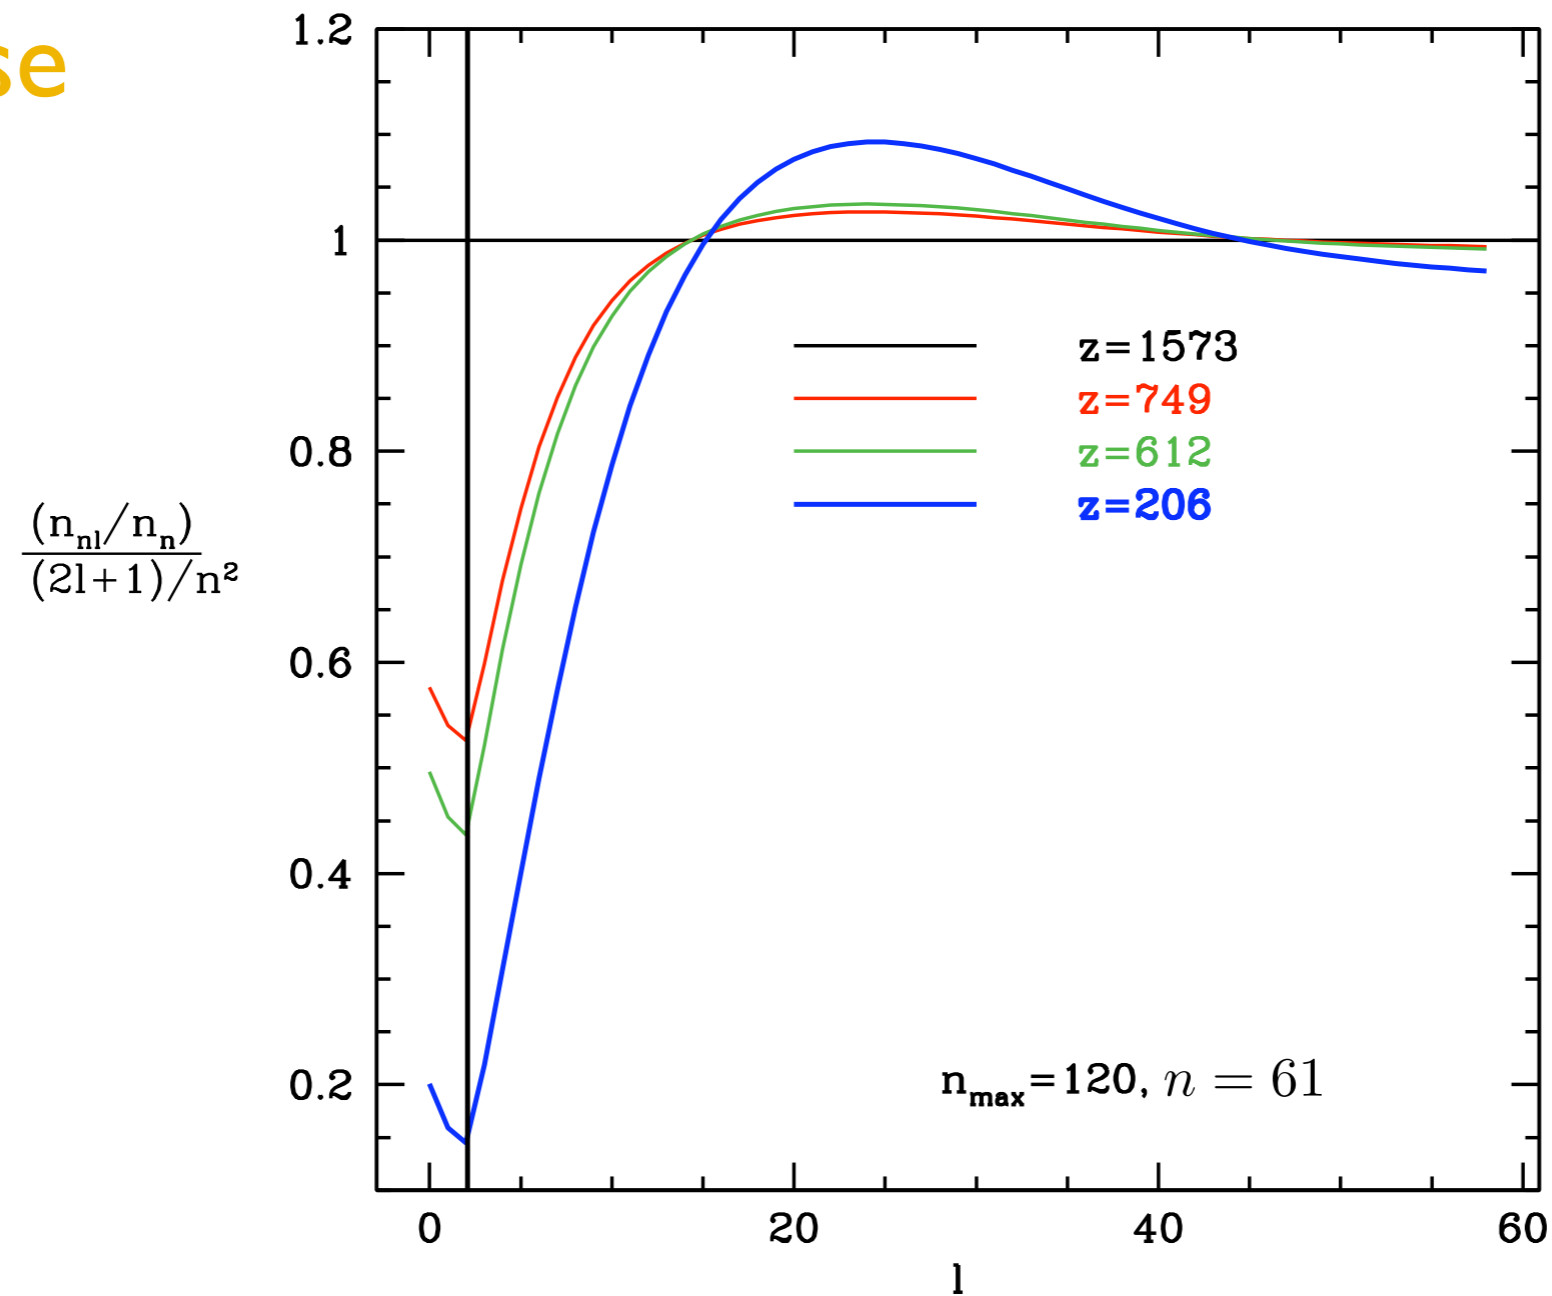

DEVIATIONS FROM BOLTZMANN EQ: l-substates

Compare with Rubino-Martin, Chluba, and Sunyaev 2006:
Similar Features!

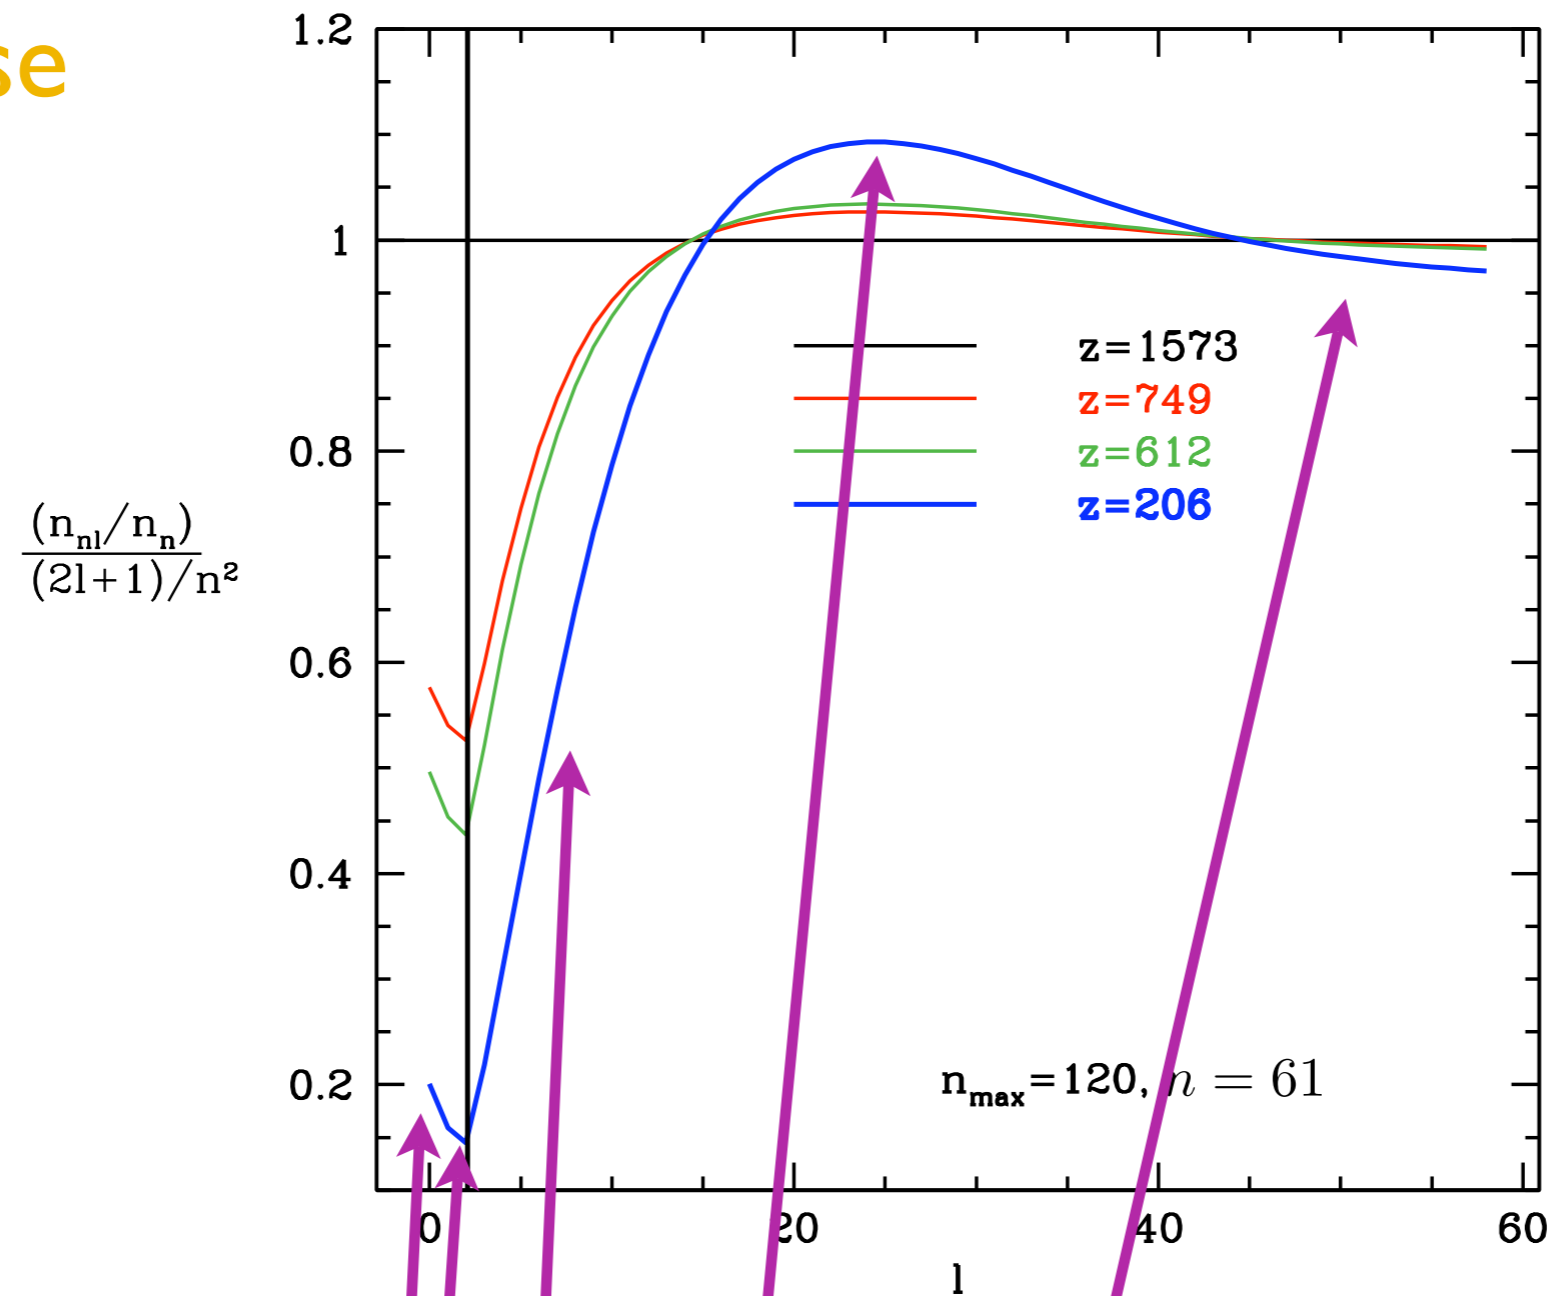

DEVIATIONS FROM BOLTZMANN EQ: I-substates

RecSparse
output

DEVIATIONS FROM BOLTZMANN EQ: I-substates

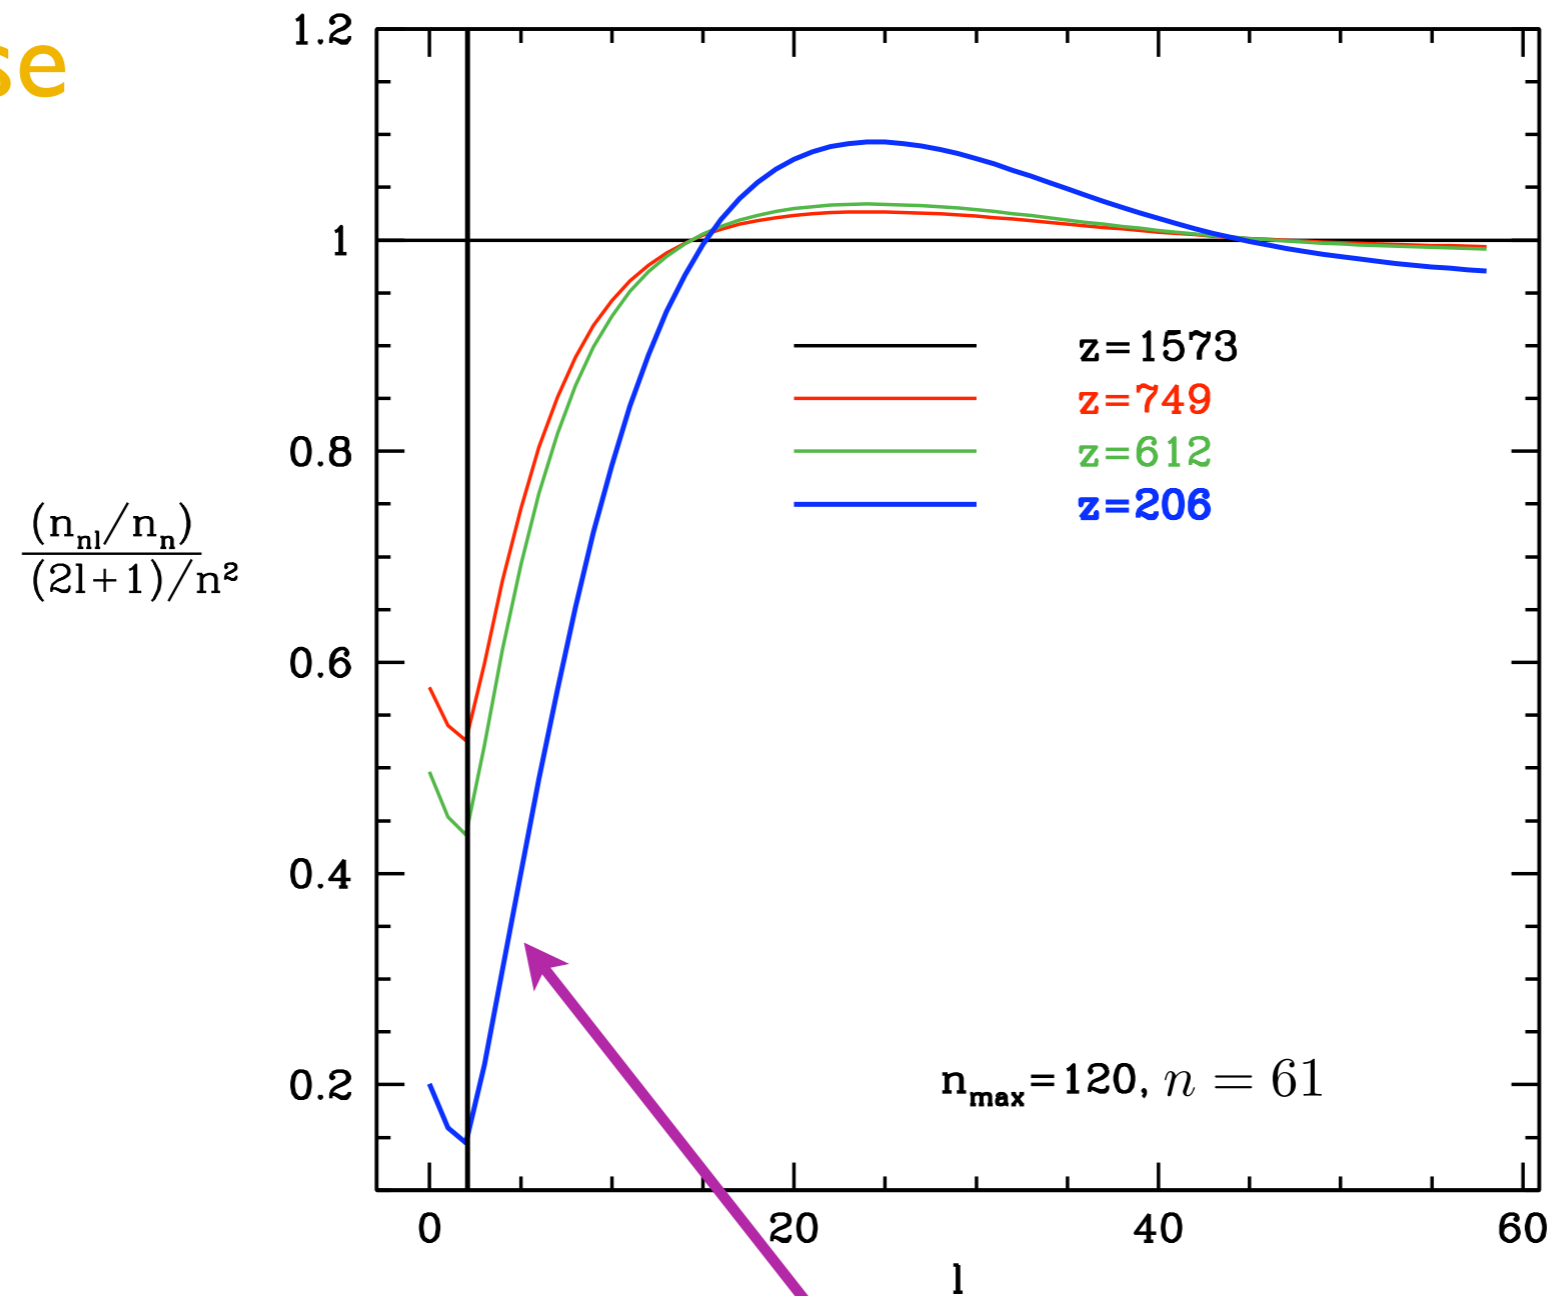

RecSparse
output

Patterns persist for high n, n_{\max}

DEVIATIONS FROM BOLTZMANN EQ: I-substates

RecSparse
output

I-substates are highly out of Boltzmann eqb'm at late times

WHAT IS THE ORIGIN OF THE $l=2$ DIP?

$$A_{nd \rightarrow 2p} > A_{np \rightarrow 2s} > A_{ns \rightarrow 2p}$$

- $l=2$ depopulates more efficiently than $l=1$ for higher ($n>2$) excited states
- We can test if this explains the dip at $l=2$ by running the code with Balmer transitions from $l=2$ artificially disabled: the blip should move to $l=1$

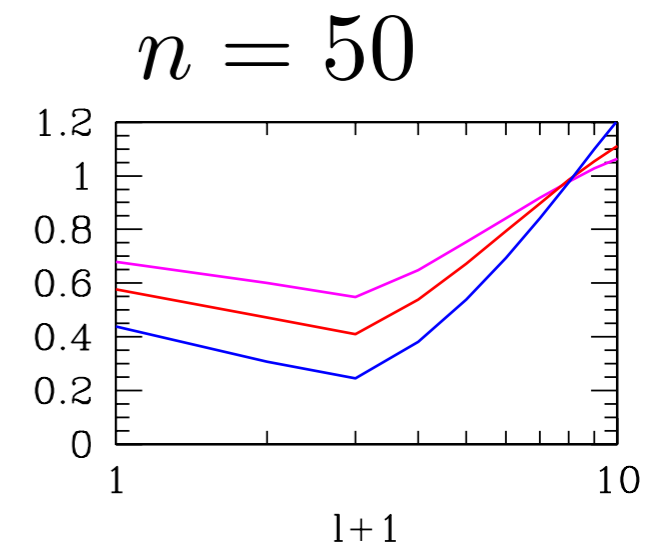

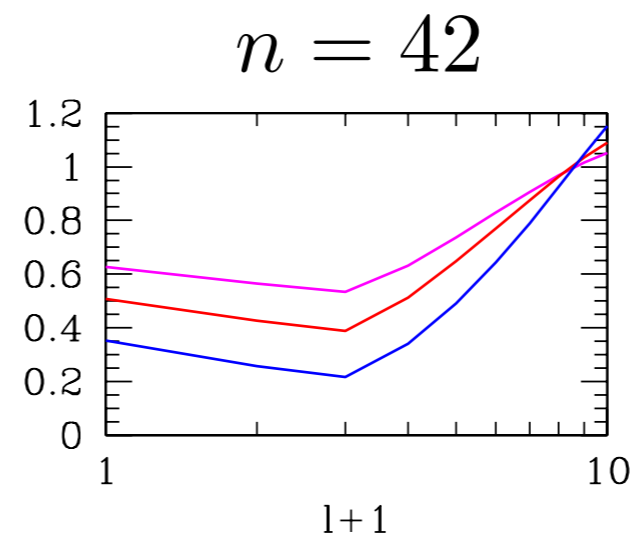

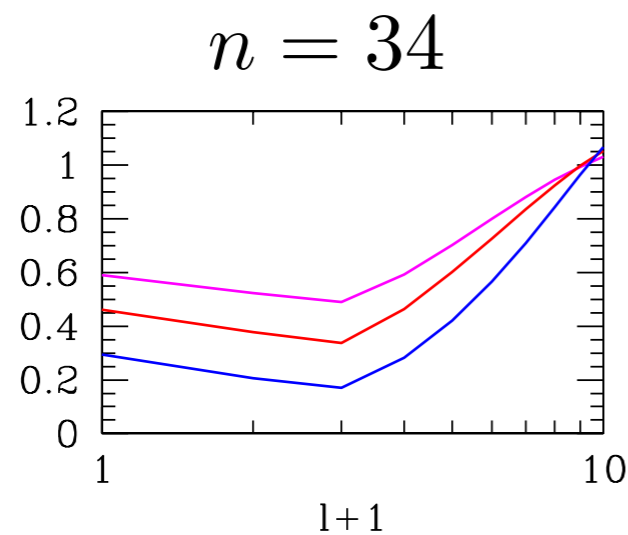

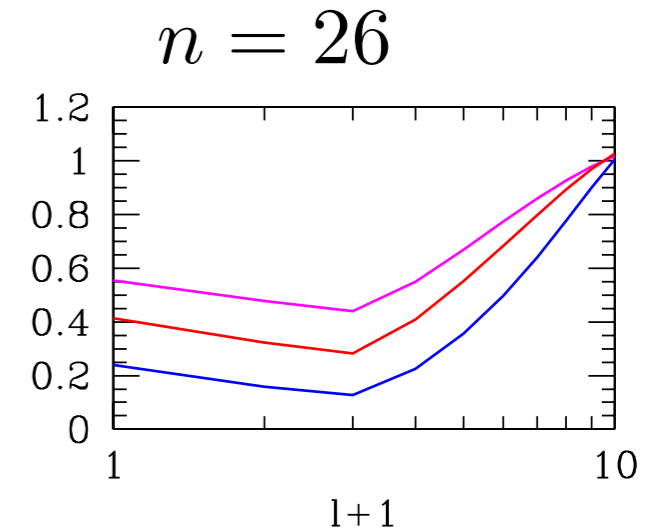

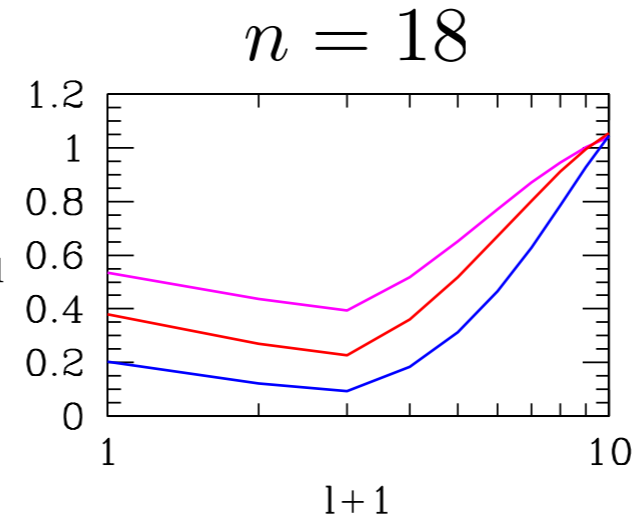

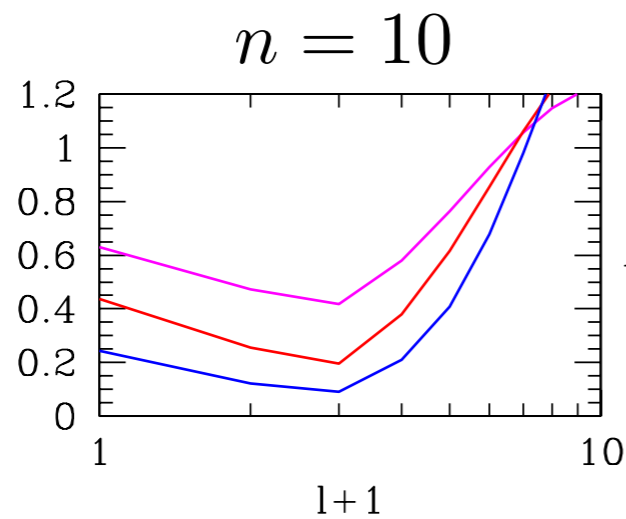

l-substate populations, Balmer lines on

$$n_{\max} = 50$$

$$z = 440$$

$$z = 320$$

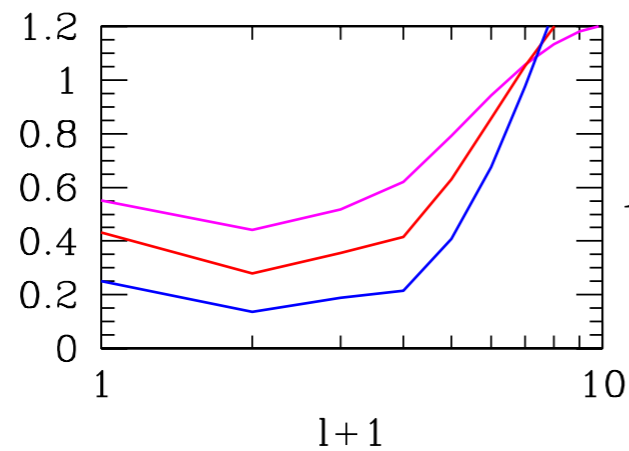

$$z = 205$$

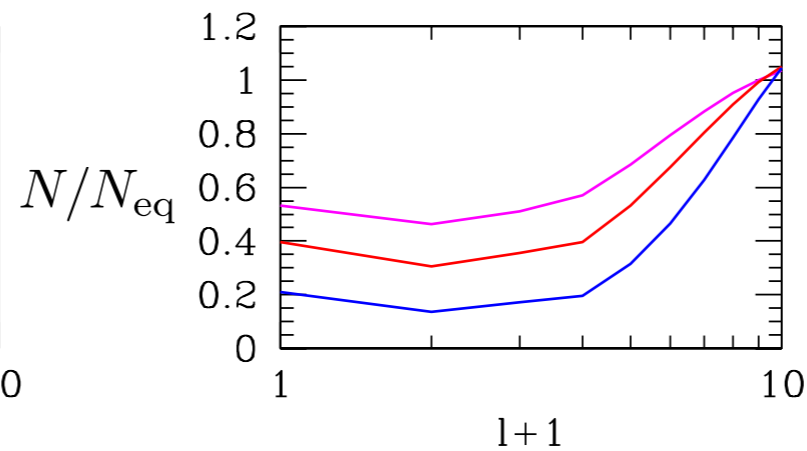

l-substate populations, Balmer lines off

$$n_{\max} = 50$$

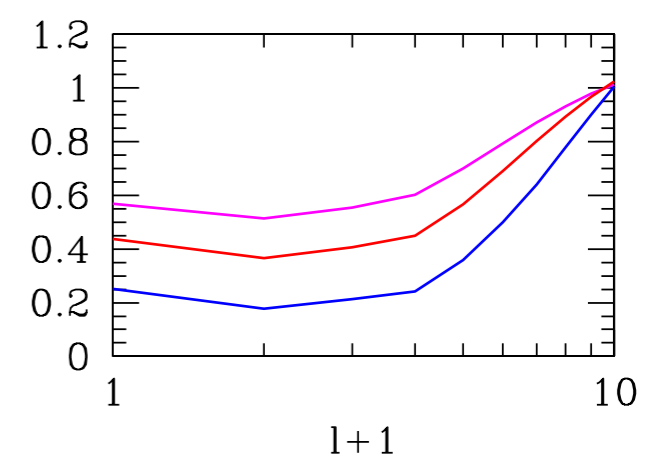

$$n = 10$$

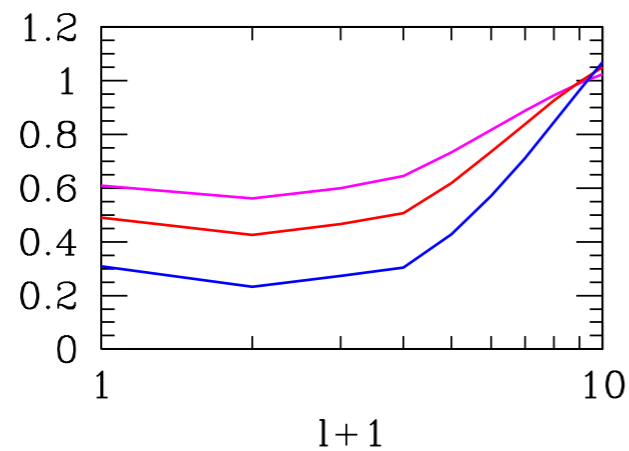

$$n = 18$$

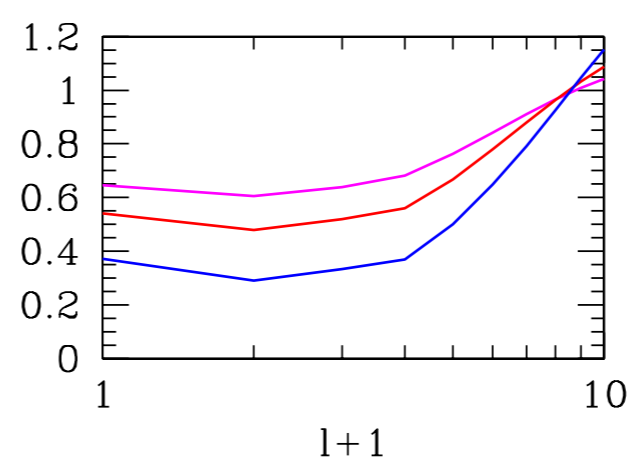

$$n = 26$$

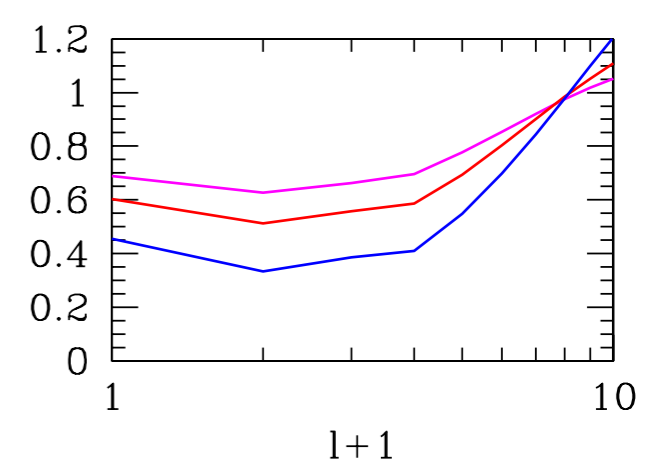

$$n = 34$$

$$n = 42$$

$$n = 50$$

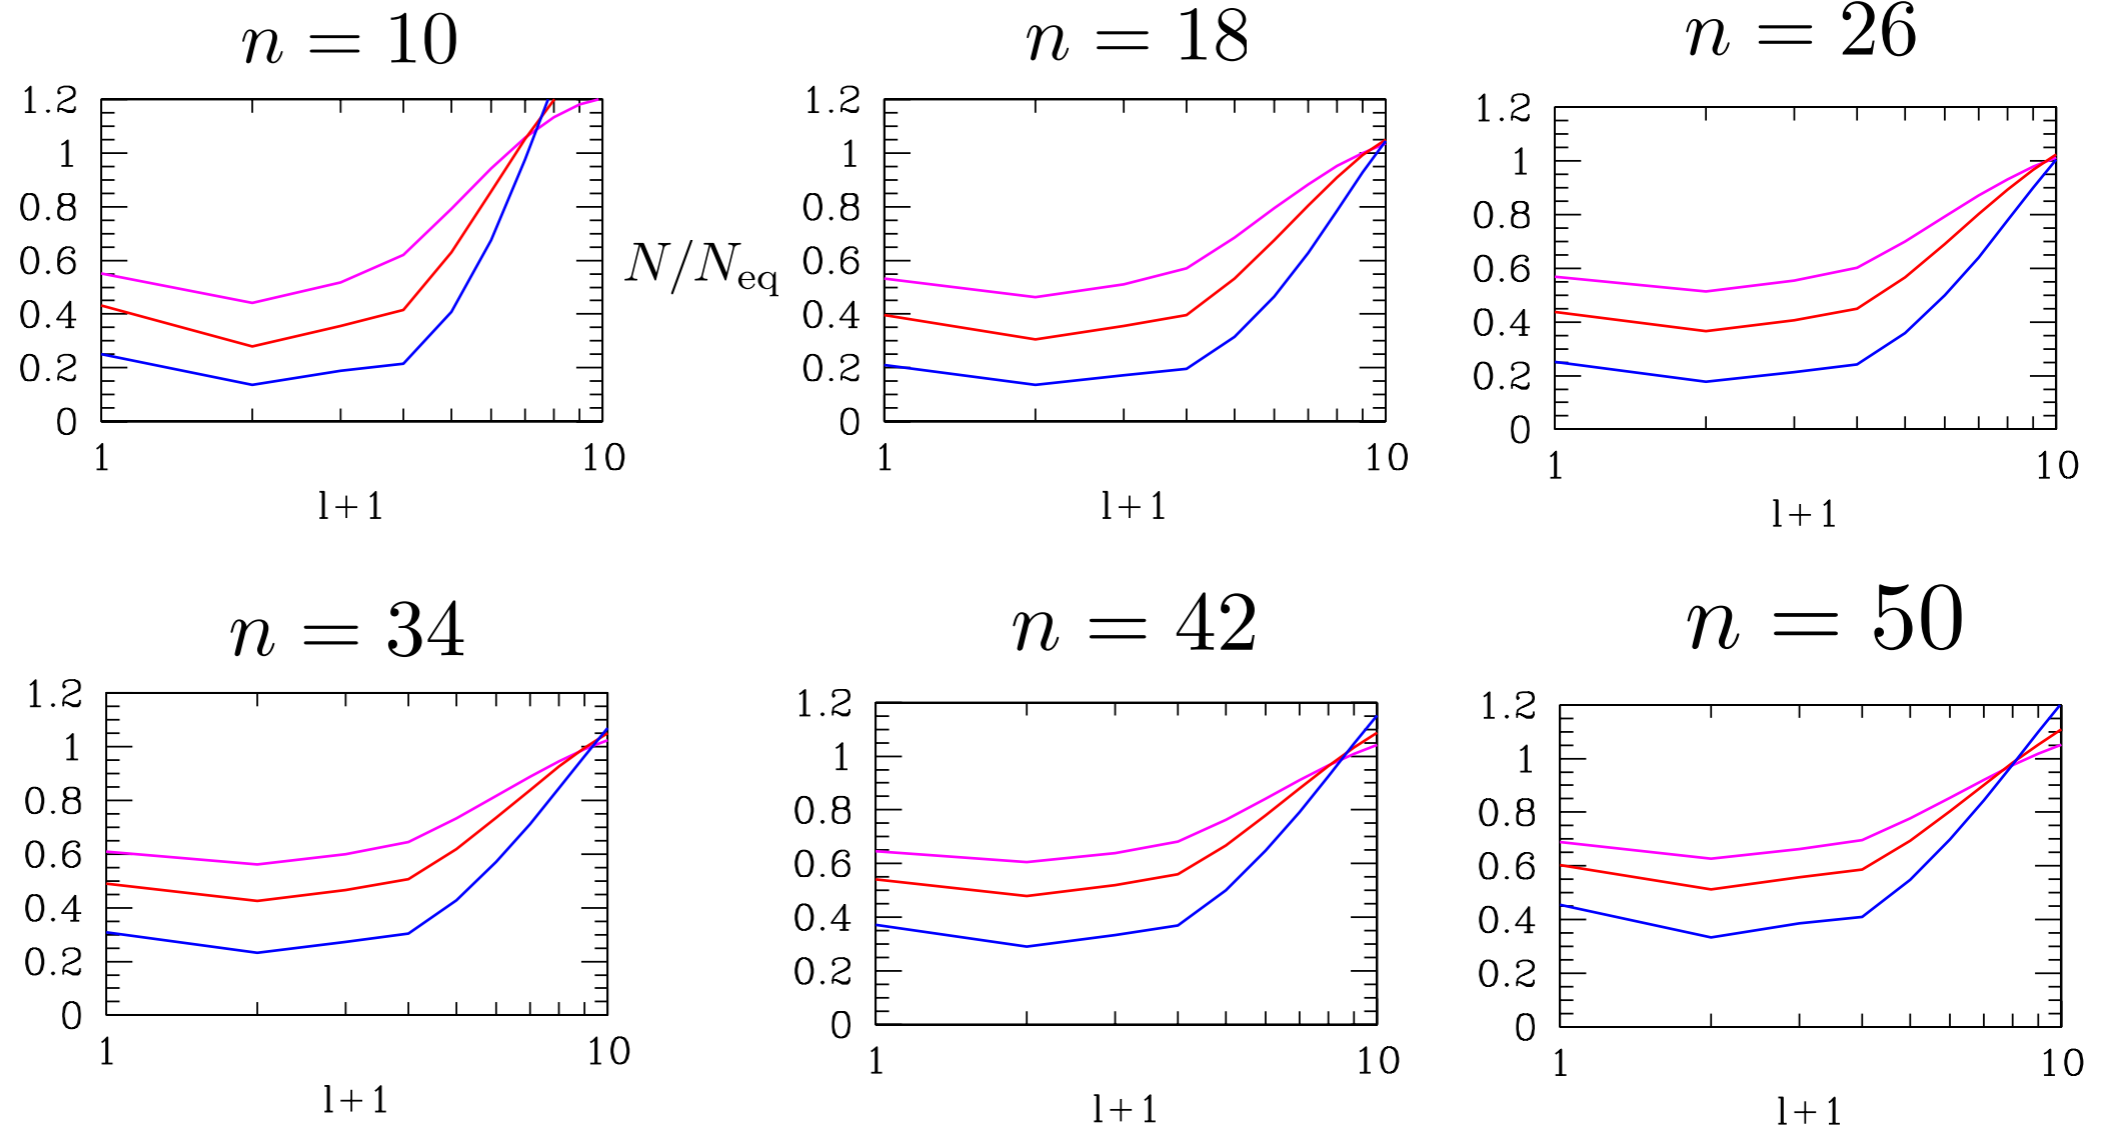

$$z = 440$$

$$z = 320$$

$$z = 205$$

l-substate populations, Balmer lines off

$$n_{\max} = 50$$

$$z = 440$$

$$z = 320$$

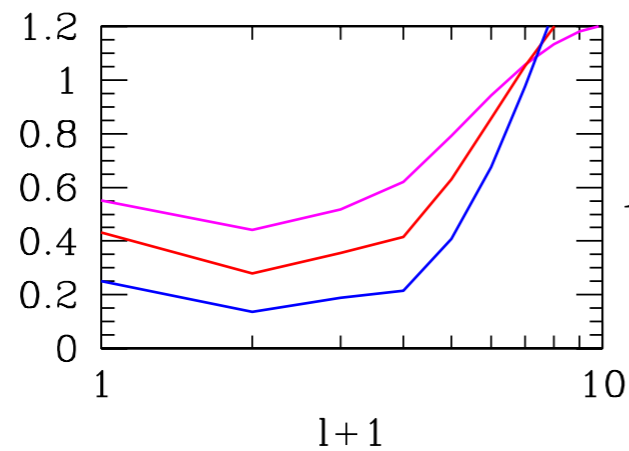

$$z = 205$$

Dip moves as expected when Balmer lines are off!

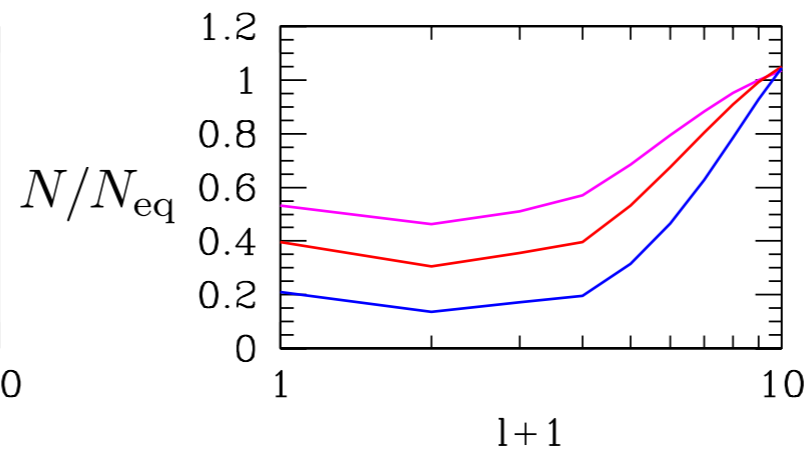

l-substate populations, Balmer lines off

$$n_{\max} = 50$$

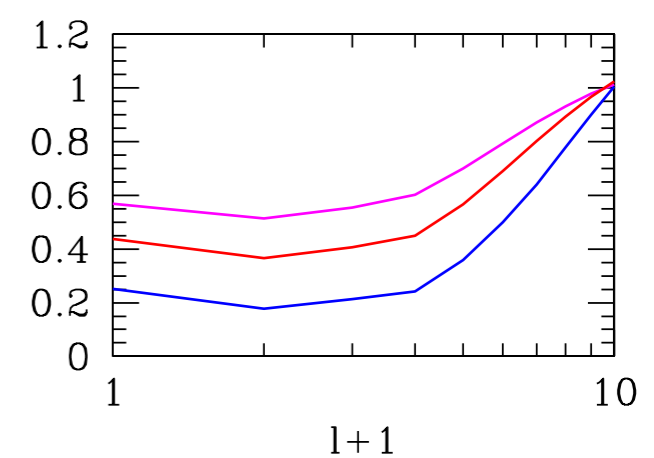

$$n = 10$$

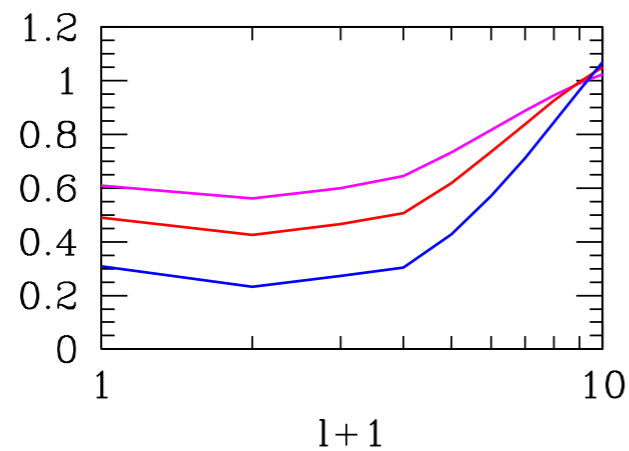

$$n = 18$$

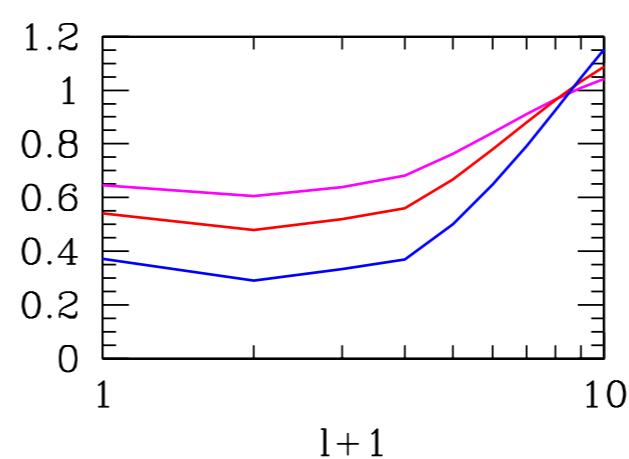

$$n = 26$$

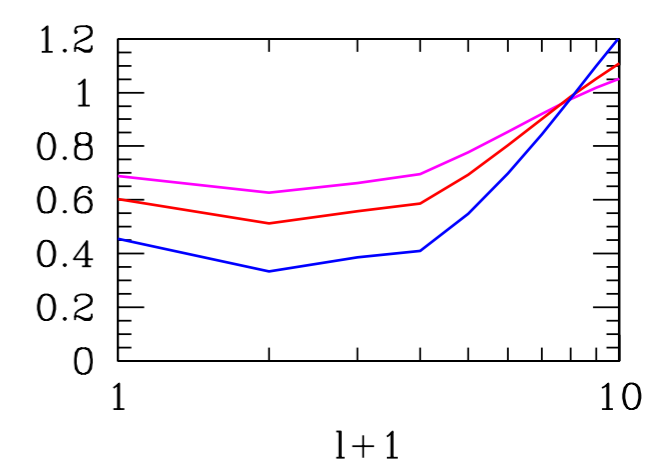

$$n = 34$$

$$n = 42$$

$$n = 50$$

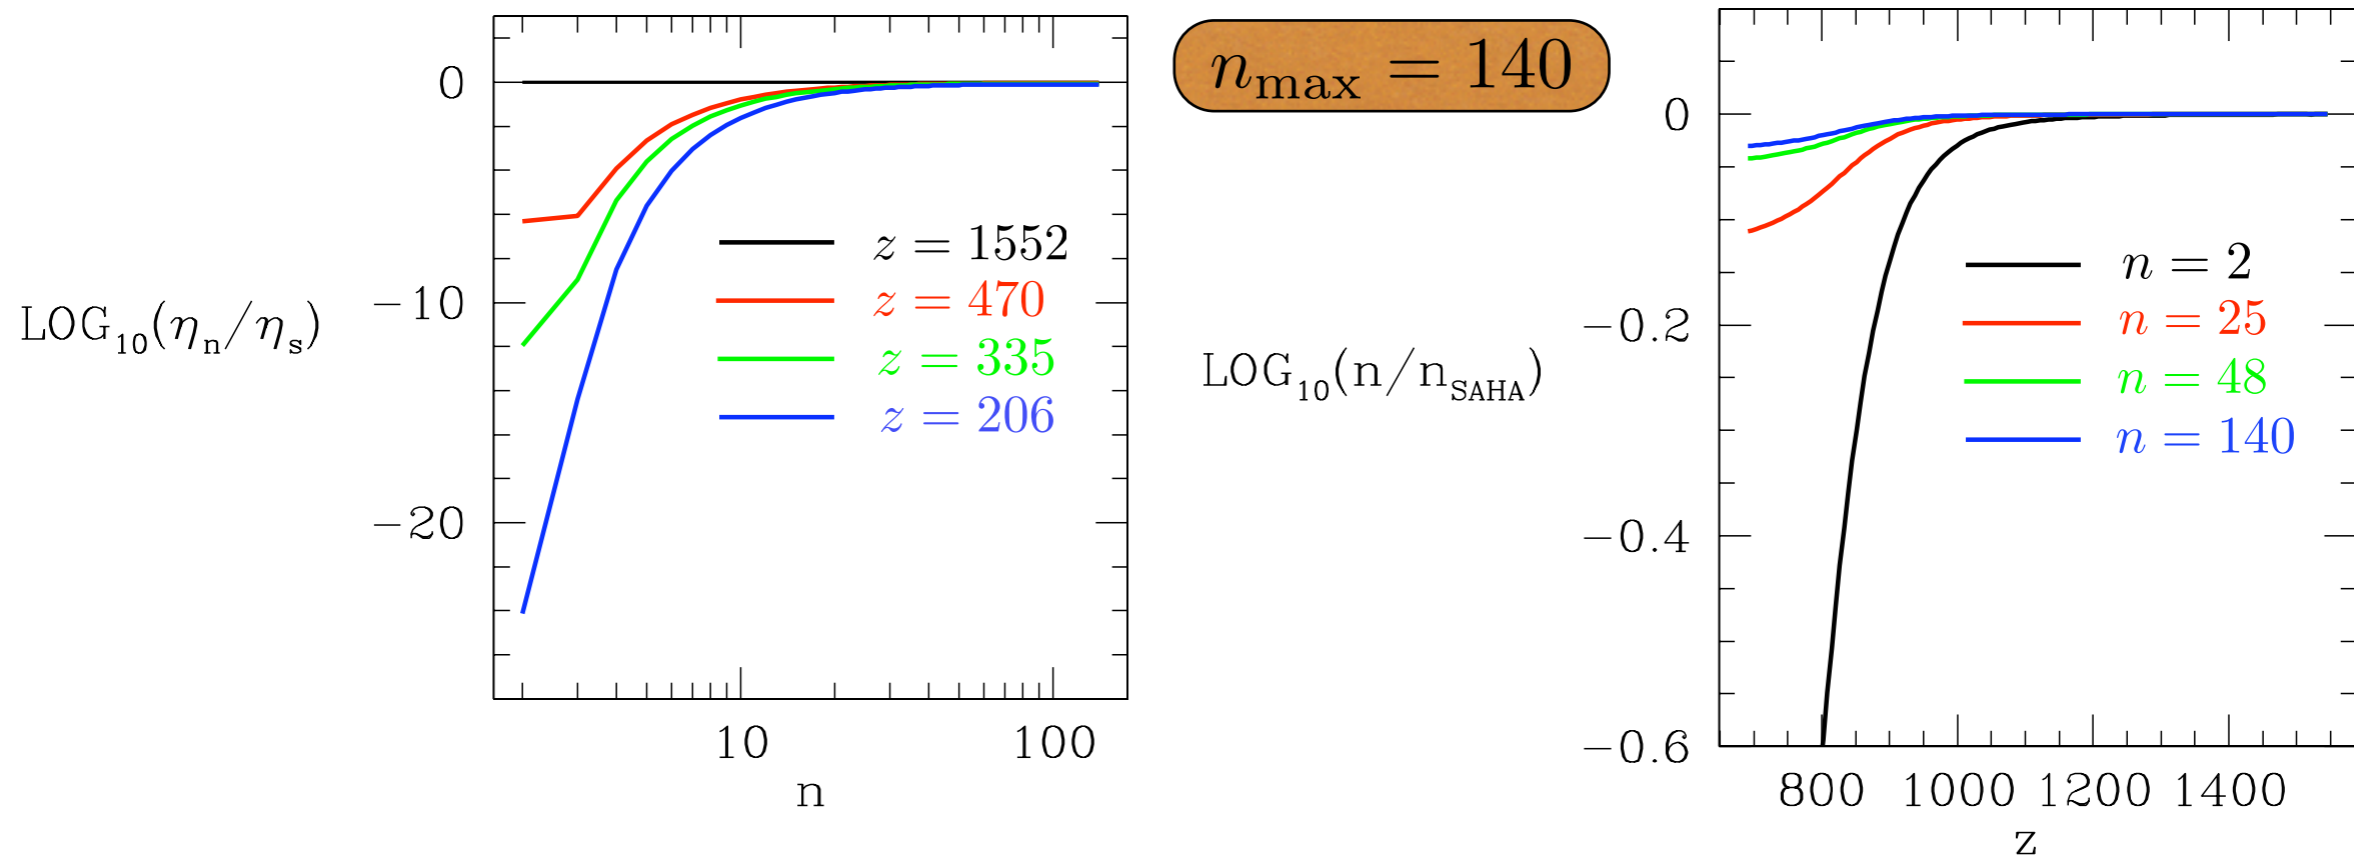

$$z = 440$$

$$z = 320$$

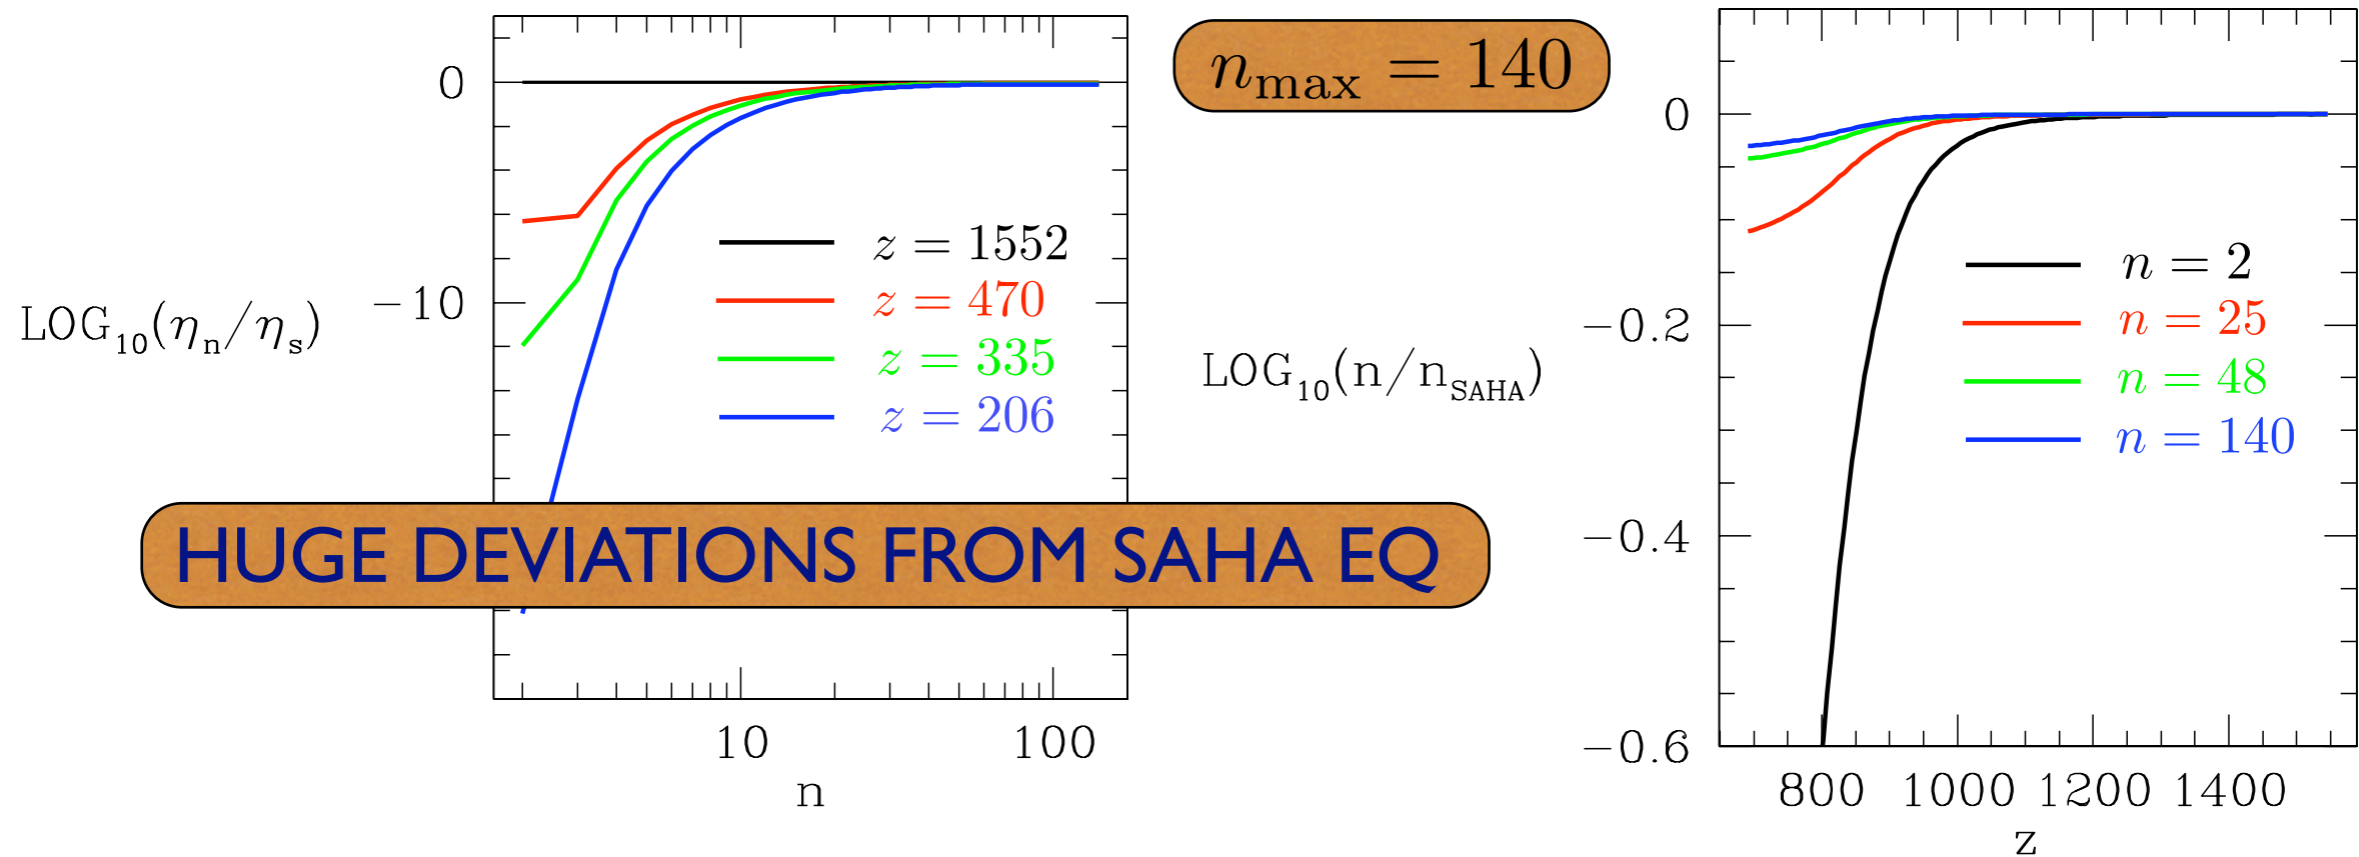

$$z = 205$$

DEVIATIONS FROM SAHA EQUILIBRIUM

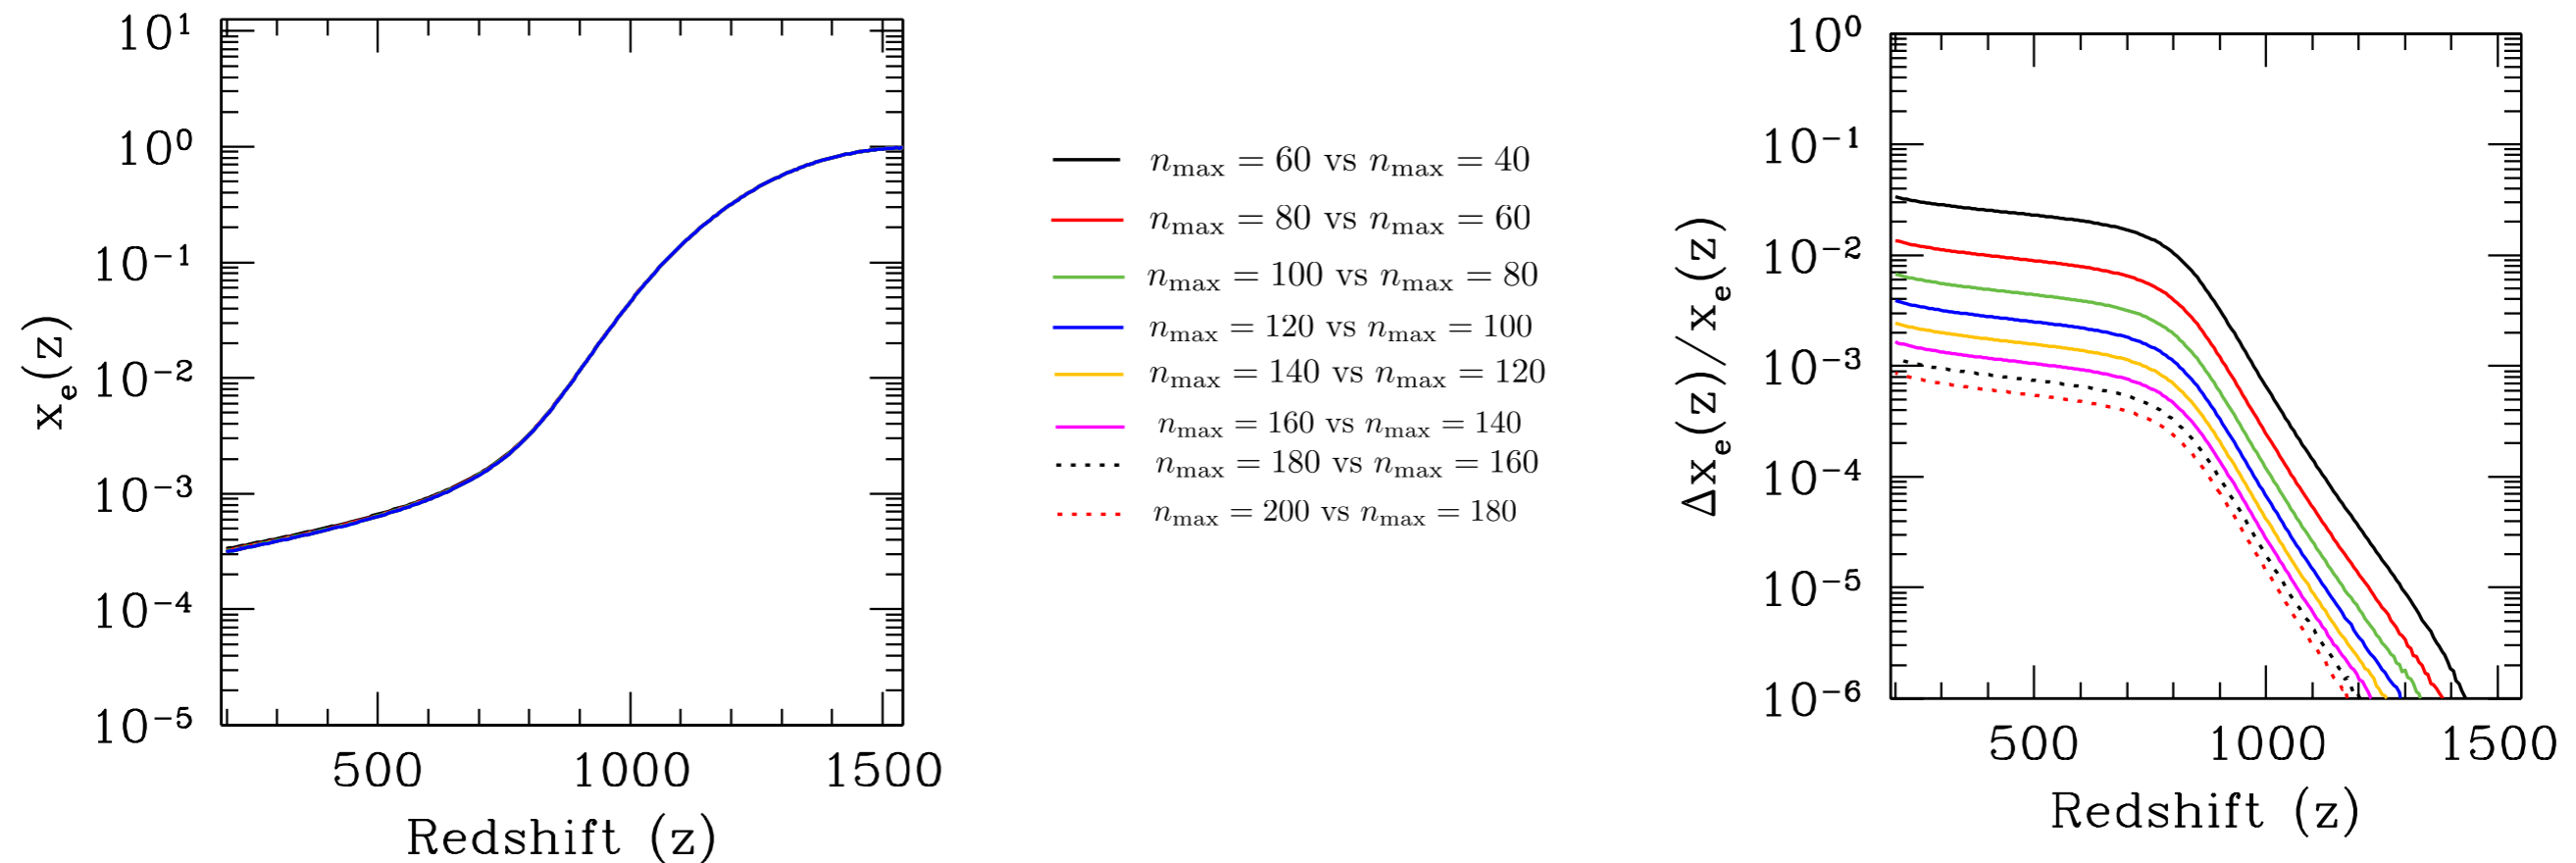

- $n=1$ suppressed due to freeze-out of x_e
- Remaining levels 'try' to remain in Boltzmann eq. with $n=2$
- Super-Boltz effects and two- γ transitions ($n=1 \rightarrow n=2$) yield less suppression for $n>1$
- Problem gets worse at late times (low z) as rates fall

DEVIATIONS FROM SAHA EQUILIBRIUM

- $n=1$ suppressed due to freeze-out of x_e
- Remaining levels 'try' to remain in Boltzmann eq. with $n=2$
- Super-Boltz effects and two- γ transitions ($n=1 \rightarrow n=2$) yield less suppression for $n>1$
- Problem gets worse at late times (low z) as rates fall

RESULTS: RECOMBINATION HISTORIES

- $x_e(z)$ falls with increasing $n_{\max} = 10 \rightarrow 200$, as expected.
- Rec Rate > downward BB Rate > Ionization, upward BB rate
- For $n_{\max} = 100$, code computes in only 2 hours

QUADRAPOLE TRANSITIONS AND RECOMBINATION

- Electric quadrupole (E2) transitions are suppressed but conceivably not irrelevant at the desired level of accuracy:

$$\frac{A_{m,l\pm 2 \rightarrow n,l}^{\text{quad}}}{A_{m,l\pm 1 \rightarrow n,l}^{\text{dipole}}} \sim \alpha^2 \approx 5 \times 10^{-5}$$

- Coupling to ground state will overwhelmingly dominate:

$$\frac{A_{n,2 \rightarrow 1,0}^{\text{quad}}}{A_{n,2 \rightarrow m,0}^{\text{quad}}} \propto \frac{\omega_{n1}^5}{\omega_{nm}^5} = \left(\frac{1 - \frac{1}{n^2}}{\frac{1}{m^2} - \frac{1}{n^2}} \right)^5 \geq 1024 \text{ if } m \geq 2$$

- Magnetic dipole rates suppressed by several more orders of magnitude

QUADRUPOLE RATES: BASIC FORMALISM

- $A_{n_a, l_a \rightarrow n_b, l_b}^{\text{quad}} = \frac{\alpha}{15} \frac{1}{2l_a + 1} \frac{\omega_{ab}^5}{c^4} \left\langle l_a || C^{(2)} || l_b \right\rangle^2 \left({}^2 R_{n_b l_b}^{n_a l_a} \right)^2$
- Reduced matrix element evaluated using Wigner 3J symbols:
$$\left\langle l_a || C^{(2)} || l_b \right\rangle = (-1)^{l_a} \sqrt{(2l_a + 1)(2l_b + 1)} \begin{pmatrix} l_a & 2 & l_b \\ 0 & 0 & 0 \end{pmatrix}$$
- Radial matrix element evaluated using operator methods

$${}^2 R_{n_b l_b}^{n_a l_a} \equiv \int_0^\infty r^4 R_{n_a l_a}(r) R_{n_b l_b}(r) dr$$

QUADRUPLE TRANSITIONS AND RECOMBINATION

- Lyman lines are optically thick, so $nd \rightarrow 1s$ immediately followed by $1s \rightarrow np$, so this can be treated as an effective $d \rightarrow p$ process with rate $A_{nd \rightarrow 1s} x_{nd}$.
- Preserves sparsity pattern of rate matrix
- Detailed balance yields net rate
$$R_{nd \rightarrow np}^{\text{quad}} = A_{nd \rightarrow 1s} \left(x_{nd} - \frac{5}{3} x_{np} \right)$$
- $x_{3d} > \frac{5}{3} x_{3p}$, so net is $3d \rightarrow 3p$. $3p \rightarrow 2s$ is fast, and $2s \rightarrow 1s$ dominates recombination rate at early times, so this accelerates recombination.
- For $n > 3$, $x_{nd} < \frac{5}{3} x_{np}$, so net is $np \rightarrow nd$. $nd \rightarrow 2p$ is fast, but $2p \rightarrow 1s$ is a slow recombination channel while optically thick. As it overtakes $2s \rightarrow 1s$, higher quadrupoles also accelerate recombination.

QUADRAPOLE RATES: OPERATOR ALGEBRA

- Radial Schrödinger equation can be factored to yield:

$$^{-}\Omega_{nl} = \frac{1}{lA_{nl}} \left[1 - l \left(\frac{d}{dr} + \frac{l+1}{r} \right) \right] \quad {}^{+}\Omega_{nl} = \frac{1}{lA_{nl}} \left[1 + l \left(\frac{d}{dr} - \frac{l-1}{r} \right) \right]$$

$$\begin{aligned} {}^{-}\Omega_{nl} R_{nl}(r) &= R_{n \ l-1}(r) \\ {}^{+}\Omega_{n \ l-1} R_{nl}(r) &= R_{nl}(r) \end{aligned} \quad A_{nl} = \frac{\sqrt{n^2 - l^2}}{nl}$$

- This algebra can be applied to radial matrix elements:

QUADRAPOLE RATES: OPERATOR ALGEBRA

- Radial Schrödinger equation can be factored to yield:

$$^{-}\Omega_{nl} = \frac{1}{lA_{nl}} \left[1 - l \left(\frac{d}{dr} + \frac{l+1}{r} \right) \right] \quad {}^{+}\Omega_{nl} = \frac{1}{lA_{nl}} \left[1 + l \left(\frac{d}{dr} - \frac{l-1}{r} \right) \right]$$

$$\begin{aligned} {}^{-}\Omega_{nl} R_{nl}(r) &= R_{n \ l-1}(r) \\ {}^{+}\Omega_{n \ l-1} R_{nl}(r) &= R_{nl}(r) \end{aligned} \quad A_{nl} = \frac{\sqrt{n^2 - l^2}}{nl}$$

- This algebra can be applied to radial matrix elements:

$${}^2R_{n' \ l-1}^{n \ l-1} = \frac{1}{A_{nl}} \left\{ A_{n'l}^2 R_{n'l}^{nl} + 2 {}^{(1)}R_{n' \ l-1}^{nl} \right\} \quad {}^{(2)}R_{n' \ n'-1}^{n \ n'-1} = \frac{2nn'}{\sqrt{n^2 - n'^2}} {}^{(1)}R_{n \ n'-1}^{nn'}$$

Diagonal!

QUADRAPOLE RATES: OPERATOR ALGEBRA

- Radial Schrödinger equation can be factored to yield:

$$^{-}\Omega_{nl} = \frac{1}{lA_{nl}} \left[1 - l \left(\frac{d}{dr} + \frac{l+1}{r} \right) \right] \quad {}^{+}\Omega_{nl} = \frac{1}{lA_{nl}} \left[1 + l \left(\frac{d}{dr} - \frac{l-1}{r} \right) \right]$$

$$\begin{aligned} {}^{-}\Omega_{nl} R_{nl}(r) &= R_{n \ l-1}(r) \\ {}^{+}\Omega_{n \ l-1} R_{nl}(r) &= R_{nl}(r) \end{aligned} \quad A_{nl} = \frac{\sqrt{n^2 - l^2}}{nl}$$

- This algebra can be applied to radial matrix elements:

$$l(2l+3)A_{n'l} {}^{(2)}R_{n' \ l-1}^{n \ l+1} = (2l+1)(l+2)A_{n \ l+2} {}^{(2)}R_{n'l}^{n \ l+2} + 2(l+1)A_{n' \ l+1} {}^{(2)}R_{n' \ l+1}^{n \ l+1} + 2(2l+1)(3l+5) {}^{(1)}R_{n'l}^{n \ l+1} \quad (1 \leq l \leq n' - 1)$$

$${}^{(2)}R_{n' \ n'+1}^{n \ n'-1} = 0$$

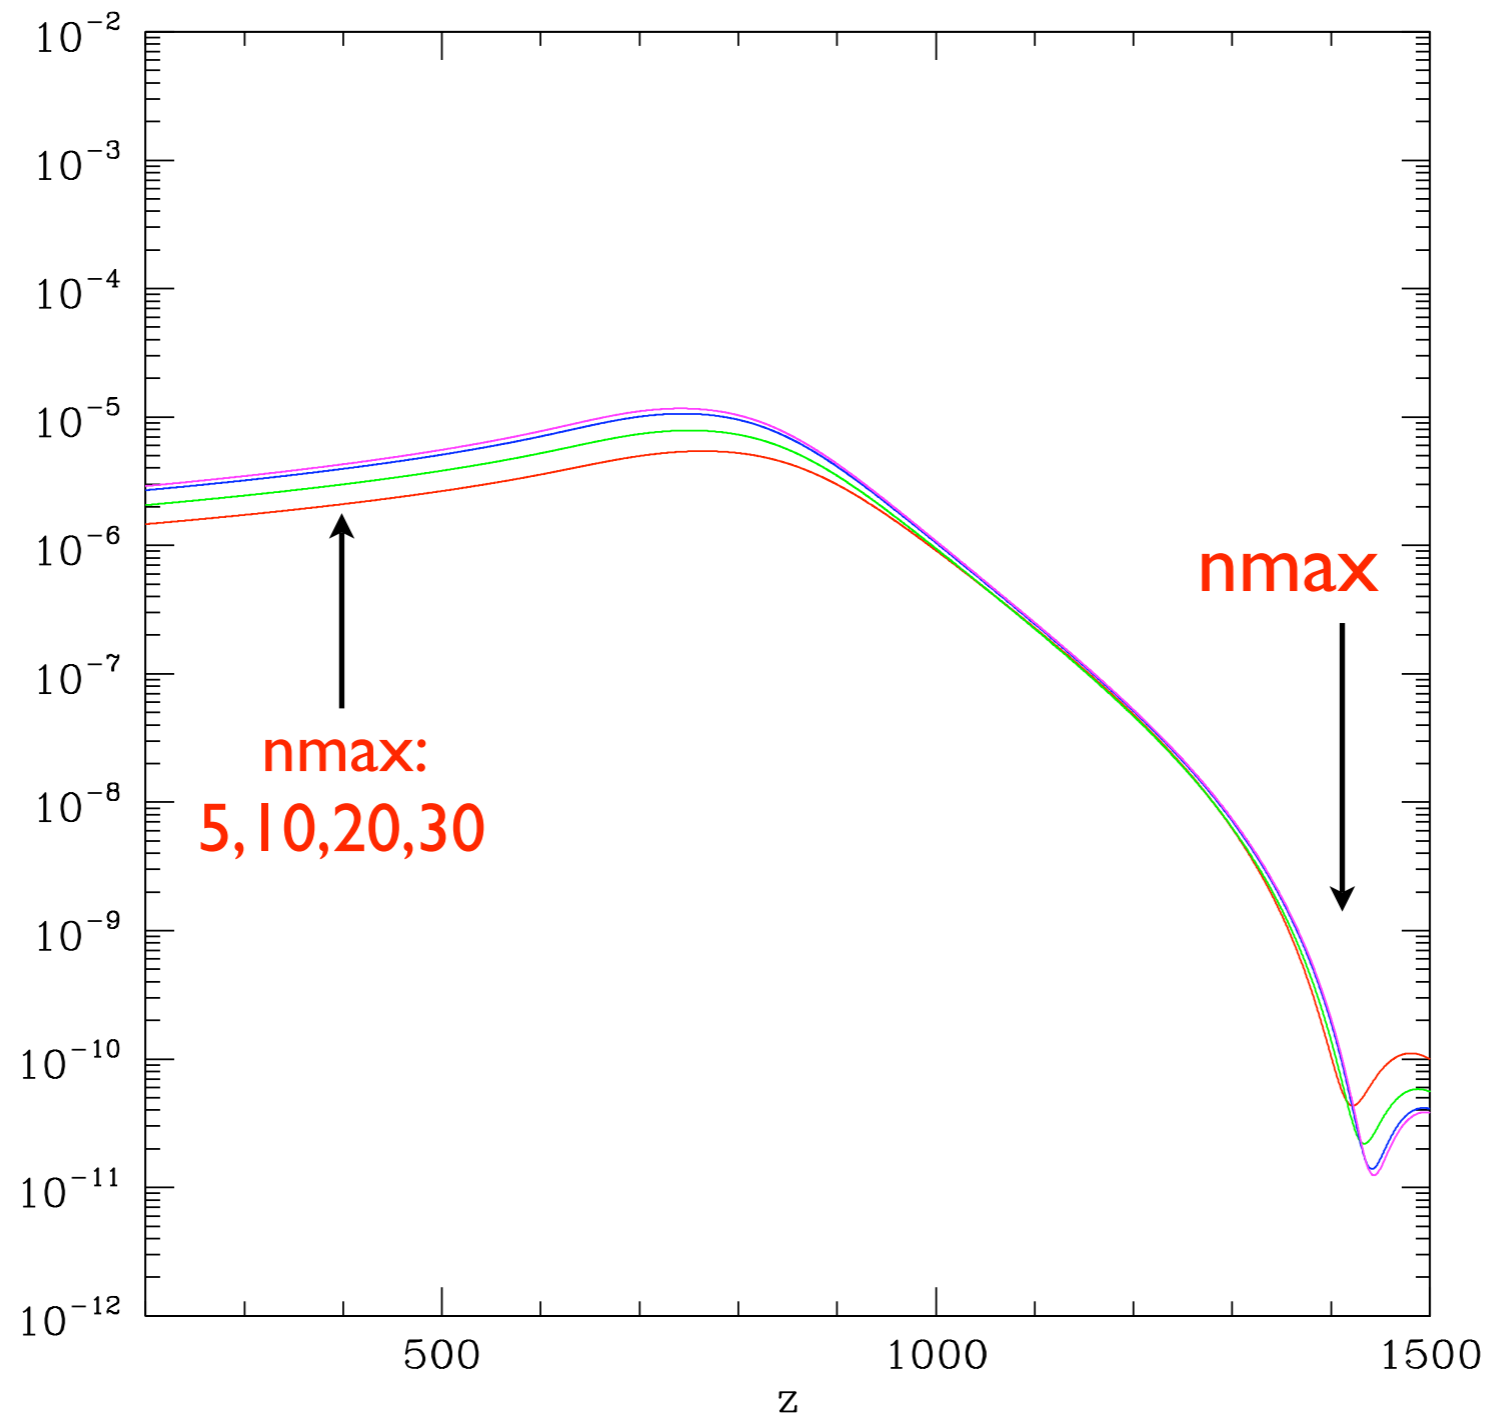

$${}^{(2)}R_{n' \ n'-1}^{n \ n'+1} = (-1)^{n-n'} 2^{2n'+4} \left[\frac{(n+n'+1)!}{(n-n'-2)!(2n'-1)!} \right]^{1/2} n' (nn')^{n'+3} \frac{(n-n')^{n-n'-3}}{(n+n')^{n+n'+3}}$$

Off-diagonal!

QUADRUPOLE RATES: VERIFICATION

- Rates were checked using WKB expressions like dipole rates
- Compared to published numerical rates of Jitrik and Bunge: 4-5 digits of agreement (Dirac vs. non-rel wf), but this would be a correction to a small correction

RESULTS: QUADRUPOLE RATES AND RECOMBINATION

WHO CARES?

I. SMEARING AND MOVING THE SURFACE OF LAST SCATTERING (SLSS)

- Photons kin. decouple when Thompson scattering freezes out

$$\gamma + e^- \Leftrightarrow \gamma + e^-$$

$$\Gamma = n_e \sigma_T c = 2.2 \times 10^{-19} \text{ s}^{-1} \frac{x_e \Omega_b h^2}{a^3} =$$

$$H = H_0 \Omega_m^{1/2} a^{-3/2} \left[1 + \frac{a_{\text{eq}}}{a} \right]^{1/2}$$

- $z_{\text{dec}} \simeq 1100$: Decoupling occurs during recombination

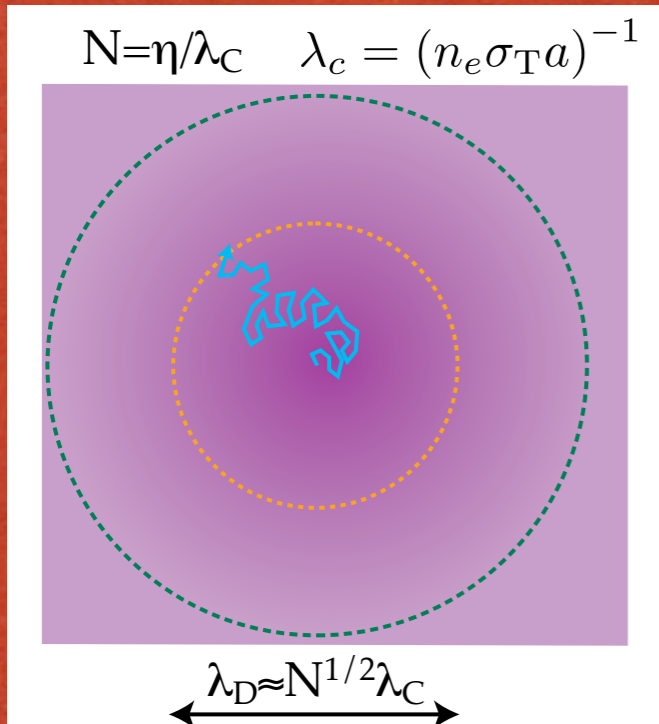

$$C_l \rightarrow C_l e^{-2\tau} \quad \text{if } l > \frac{\eta_0}{\eta_{\text{rec}}}.$$

$$\tau = \int_0^{\eta_{\text{dec}}} d\eta n_e [\eta] \sigma_T a(\eta)$$

WHO CARES?

II. THE SILK DAMPING TAIL

- From Wayne Hu's website

$$l_{\text{damp}} \sim 1000$$

- Inhomogeneities are damped for $\lambda < \lambda_D$

$$k_D^{-2}(\eta) \simeq \int_0^\eta \frac{d\eta'}{6(1+R)n_e[\eta']\sigma_T a[\eta']} \left[\frac{R^2}{1+R} + \frac{8}{9} \right]$$

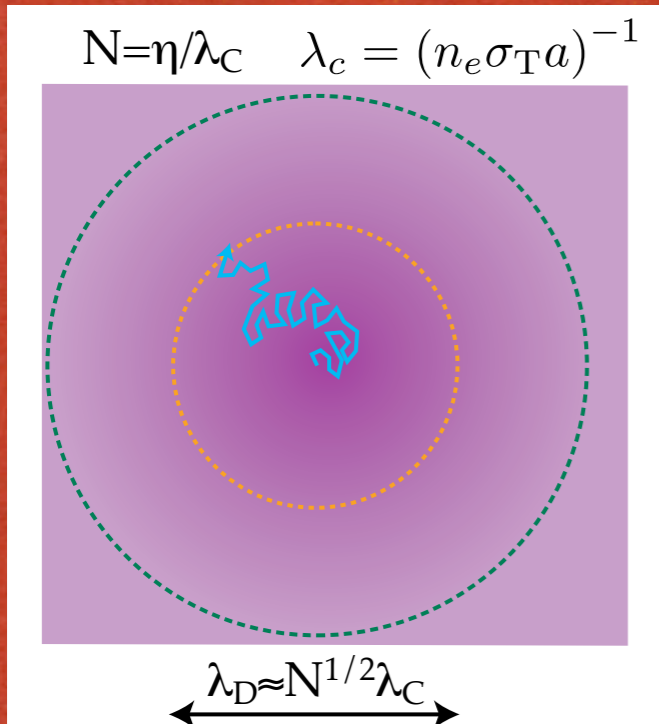

$$R = \frac{3\rho_b^0}{4\rho^\gamma}$$

$$|\Theta_l(\eta_0)| \simeq \int_0^{\eta_0} d\eta \, \dot{\tau} e^{-\tau(\eta)} e^{ik \int d\eta c_s} e^{-k^2/k_D^2(\eta)} \tilde{\delta}(k) j_l(k(\eta - \eta_0)) dk$$

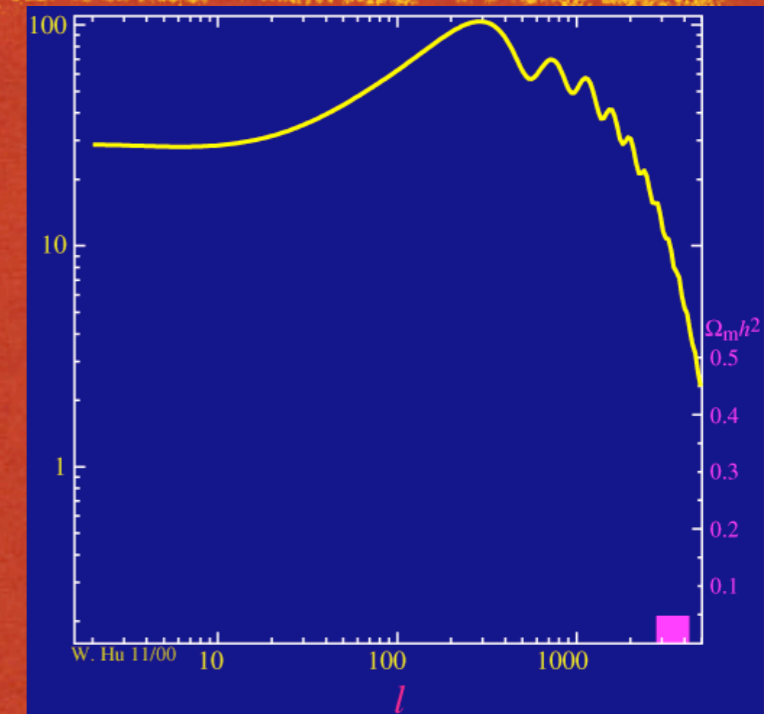

WHO CARES?

III. FINITE THICKNESS OF THE SLSS

- Additional damping of form
$$|\Theta_l(\eta_0, k)| \rightarrow |\Theta_l(\eta_0, k)| e^{-\sigma^2 \eta_{\text{rec}}^2 k^2}$$

WHO CARES?

IV. CMB POLARIZATION

- Need to scatter quadrupole to polarize CMB

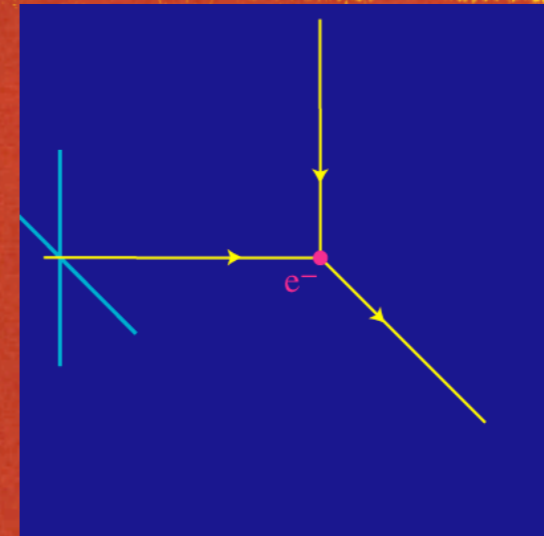

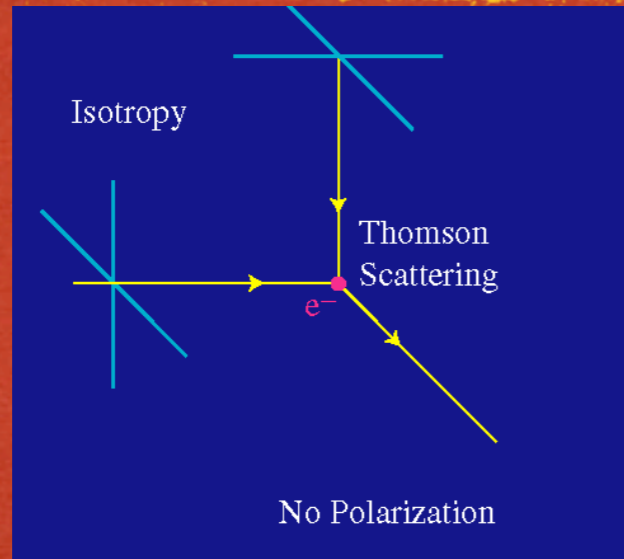

$$\Theta_l^P(k) = \int d\eta \dot{\tau} e^{-\tau(\eta)} \Theta_{T,2}(k, \eta) \frac{l^2}{(k\eta)^2} j_l(k\eta)$$

- Need time to develop a quadrupole

$$\Theta_l(k\eta) \sim \frac{k\eta}{2\tau} \Theta_l(k\eta) \ll \Theta_l(\eta) \text{ if } l \geq 2, \text{ in tight coupling regime}$$

WHO CARES?

IV. CMB POLARIZATION

- Need to scatter quadrupole to polarize CMB

TEMPERATURE C_l s

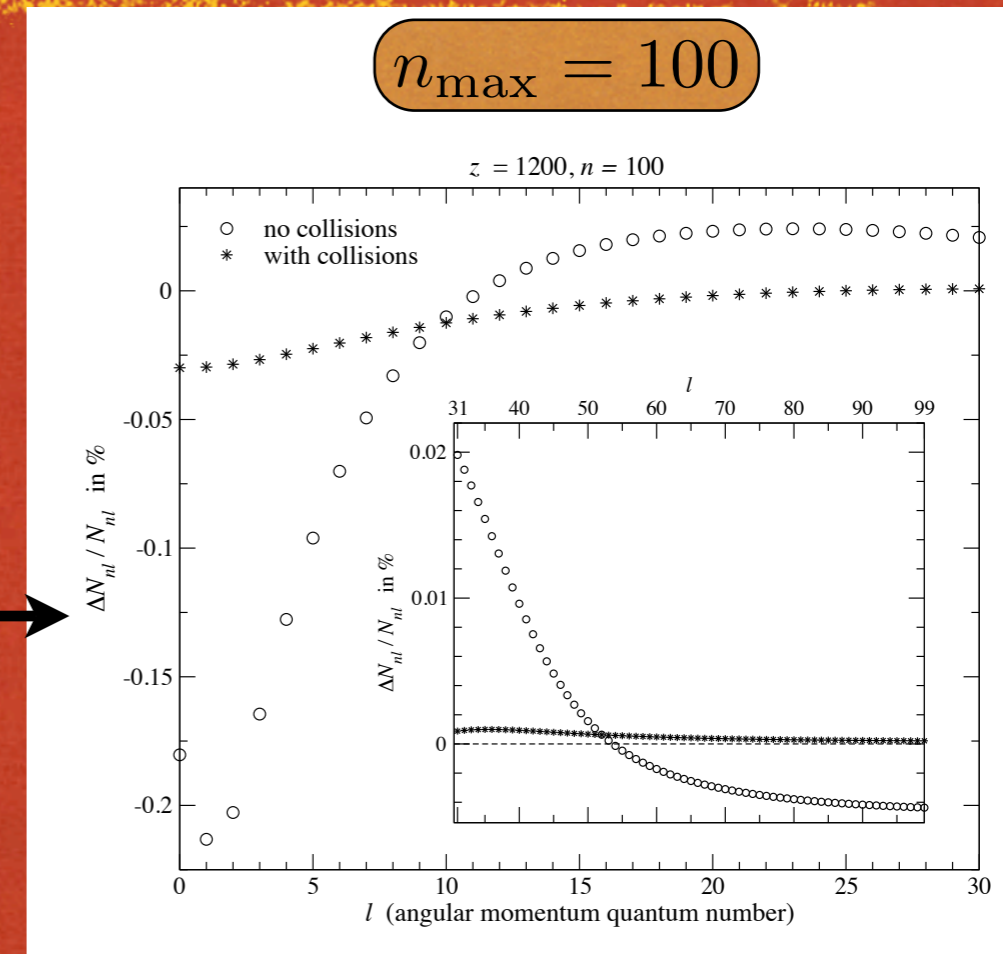

EE POLARIZATION C_l s

Lower τ after LSS, wider LSS \rightarrow more polarization

ATOMIC COLLISIONS

- For fixed n , l -changing collisions bring different- l substates closer to statistical equilibrium (SE)
- Being closer to SE speeds up rec. by mitigating high- l bottleneck (Chluba, Rubino Martin, Sunyaev 2006)
- Theoretical collision rates unknown to factors of 2!
 - $b < a_0 n^2 \rightarrow$ multi-body QM!
 - $t_{\text{pass}} < t_{\text{orbit}} \rightarrow$ Impulse approximation breaks down!
- Next we'll include them to see if we need to model rates better

WRAPPING UP

- Start using a more efficient integration
- Incorporation of Yacine's line-overlap formalism in place of Sobolev approximation
- Collisions
- Effective source term for omitted higher levels- near Saha eq., should be tractable
- Full incorporation into CMBFAST/CAMB and analysis of errors/degeneracies with cosmo. parameters
